

UNLOCKING YOUR ECO

If you are experiencing issues with your ECO not accepting programming, changing polarity, or just not acting correctly, it is possible that your ECO module is 'Locked'.

To Unlock the Unit:

1. Cut a small piece of wire.
2. Expose both ends approximately 1/4".
3. On the unit, verify Red is connected to 12v + and black is connected to a chassis ground. (2 wire red plug on face of unit)
4. On the side of the module, there is an unused plug containing 8 pins.
5. Using small piece of wire, 'bridge' the outer-most pins on this plug input. (As a result, a '1' should appear on the display)
6. Leaving right side on the farthest pin, move the left side one pin over. (As a result, a '2' should appear on the display)
7. Move the left side of the wire back to the original pin location (as a result, the '1' should re-appear)
8. Remove wire from pins.

Your ECO module should now be unlocked.

To verify, follow programming procedures for 'Changing Polarity' from original ECO instructions.
