

PICTURE-TAKING GUIDE

Be sure to get the full scope of your space when taking digital images. Start off by taking an image of each wall entirely. Then stand in each corner of your room and take an image facing outward into the space. You also need to take images of your floor and ceiling so we can use it as a reference guide in our design process. It helps to have an image of the ceiling to see existing lighting and details of the ceiling. Then take detail shots of focal points in the space, i.e., fireplace, built-ins, architectural elements etc. We will also need images of any existing pieces that you would like to keep so we can incorporate them into your design plan. Remember, there are never too many pictures. The more you send us the better.
