*Elbow Supination Pronation*

The only tissue elongation device capable of treating flexion, extension, pronation and supination loss in a single product.

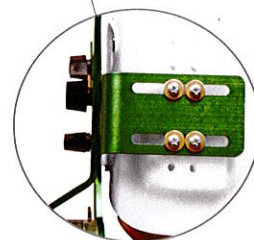

Proprietary hinge allows for static-progressive and/or dynamic stretch with the flip of a switch.

Adjustable "L" bracket allows the cuff to tilt, maximizing soft tissue distribution and patient comfort.

The Stat-A-Dyne hinge is designed to provide infinite ROM, which eliminates brace "bottom out".

Carry angle adjustability accommodates gender or pathological differences.

Radial based pronation and supination cuff ensures anatomically correct forearm rotation.

# Stat-A-Dyne®

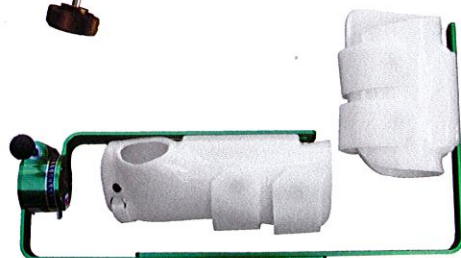

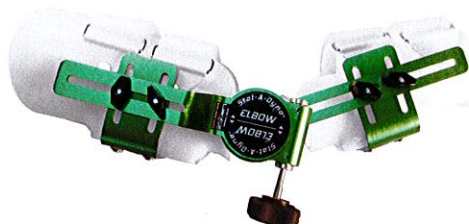

Stretching your range of possibilities

Static and/or Dynamic stretch  
from one ROM Product.

Custom Cuffs for maximum soft  
tissue capture facilitating  
terminal End ROM.

Dynamic Mode (LLPS) may be  
used to address soft to  
moderate end feels during long  
rest periods.

Static-Progressive Mode (SPS)  
may be used to address  
moderate to hard end feels  
utilizing shorter wear times.
