The All-New Flex – Light, Adjustable, Compact, TSO certified

The newest addition to the Clarity Aloft headset range is a big departure from previous designs and ushers in a new standard for in-ear headsets.

“The Flex represents everything we’ve learned from years of developing headsets and having conversations with pilots about what’s important to them,” said Aloft Technologies President, Bill Waterman.

Not only is it the lightest model yet from Clarity Aloft (which is saying something for the company who has been leading the industry since 2004), it is also the most customizable. Pilots using the Flex can set the microphone boom on the right or left, adjust the boom length and headband circumference, and collapse it flat for storage. No other headset will disappear so completely onto your head or into your flight bag.

This feature-rich design is also TSO certified. What sets it apart from other TSO certified headsets is that it’s light AND quiet. Its 29-47dB of attenuation means you can protect your hearing, be exceptionally comfortable, and arrive less fatigued.

The next generation of Clarity Aloft headsets is here.
