

Water-Melon™ Alco-Activated Appliance instructions

Step 1

Apply 91% or higher Isopropyl Alcohol liberally to the area the appliance is to be attached to.

Step 2

Place the appliance into the still wet Alcohol. Try to remove as many air pockets under the piece as possible. Press and hold the appliance in place until it bonds.

Step 3

Continue laying the appliance into the alcohol, pressing as you go.

Step 4

Apply Alco-Activator™ to the top of the appliance. This makes the appliance almost clear. No need for foundation. Maybe a little blood color though.

Step 5

Blend the appliance with alcohol. This improves the clarity and softens the plastic. Sometimes your finger can help blend the edge too if the Water-Melon™ is soft enough.

Step 6

Apply color to the piece. Begin with darker color to show depth.

Step 7

Apply red color to the cut. No need to be pretty or perfect. Apply red color to any area outside the cut that should have blood.

Step 8

Keep the pattern random but at the same time logical. The blood should have a reason but also needs to look organic or natural. Not contrived.

Then, when you have had enough and are ready to scream just remember when you had to worry about REMOVAL. Do you have remover? Do you need remover? Not with Water-Melon. It peels off AND is reusable if you're careful when peeling.
