

A geomagnetic field runs through the earth from the North Pole to the South Pole. Research shows that birds find their direction and positioning via this geomagnetic field. Bye Bye Birdies special magnetic system disturbs the geomagnetic field. Birds avoid the sphere because it disturbs their sense of direction.

Installation:

Install the Dual in a spot where the presence of birds is a problem, i.e from a tree branch, or hang from a non-magnetic pole such as plastic or bamboo.

Hang in pairs 9m apart, on a 600mm string

If Bye-Bye Birdie Dual is set up at:

Height of 7 feet: Dual covers approximately 20 feet in radius

Height of 15 feet: Dual covers approximately 35 feet in radius

Remove bird's nests and clean up the droppings completely with detergent. Birds may return to a spot if the scent remains.

Install with a non-magnetic pole and string. Any magnetic material absorbs Bye Bye Birdies magnetic power

If there is a magnetic object, install Bye Bye Birdies as far away as possible from the object.

Install to allow for wind rotation so the maximum magnetic potential is emitted, and the reflection of sunshine off the holographic surface works as an addition deterrent.

It may take one to two weeks before the birds start to avoid the area.

Warning

- Do not attempt to disassemble, as it may reduce product performance
- This device emits magnetic rays and may interfere with the normal function of cardiac pacemakers
- Keep two feet away from computers, floppy discs, magnetically coded credit cards and any other magnetically coded items as damage or de-coding may occur.
