

## Successful Bird Control in large Air Force Hangar.

**Description.** 38m wide x 75m long with doors that fully open at each end. Large timber trusses with thousands of good bird perch and nest areas. This building has had a long history of bird pest issues that no one had been able to solve successfully. Sparrows, Starlings and Swallows were the main culprits. Pestgard was requested to assess the site and provide a proposal for a solution.

**Equipment required.** At each end of the building, the following equipment was specified:- Cobratech 700 to diffuse the Fog Force bird repellent, 750 watt blower fan and a Bird Chase Laser with 80 degree rotator.

**31-07-2013** The equipment was installed.

**13-08-2013** All good so far. The bird numbers have reduced already.

**2-09-2013** Not many birds around. Still find some debris after the weekends.

**25-11-2013** Virtually no birds around and no debris after the weekends. Very happy with the results.
