

BLACKOUT™

BedBug Detector

A more *attractive choice* for bed bug detection

No tape.

No talc.

No breakage.

BlackOut™ is the latest innovation in bed bug detection. **BlackOut™** is used to detect the presence of bed bugs in a structure by simply placing the device under the legs of beds, upholstered furniture, etc. The **BlackOut™** will intercept bed bugs as they move around in search of a blood meal.

This cutting-edge interception device was developed by leading bed bug expert *Jeffrey White of BedBug Central*. Preliminary tests have shown **BlackOut™** to be both a highly effective interception device and aesthetically pleasing compared to other devices currently on the market.

Powderless Deadfall Trap

BLACKOUT™
BedBug Detector

VS

Other Interception Devices

What is the difference between BlackOut™ & other like devices?

BlackOut™

- Black color is:
 - Attractive to bed bugs
 - Allows easier identification of early instars
 - Aesthetically pleasing
- No additives or powder necessary
- Crack & break resistant due to stronger grade of plastic
- A strong yet recyclable plastic
- Textured exterior surface eliminates need for unsightly tape

Competitive Devices

- Most commonly white in color and does not blend well with furniture
- Makes identifying of early instars difficult
- Uses messy powders with a degree of maintenance
- Frequent breakage due to inferior or recycled plastics
- Relies on tape to promote advancing of bugs into its well
