

Unsealed headset Installation instructions

We recommend that you have your headset installed by a professional using special tools. If you decide to do it yourself, here are some tips that may be useful:

1. REMOVE headset bearings BEFORE installing the headset cups and put them in a safe, clean spot.
2. Put a film of grease INSIDE the headtube before installing the cups.
3. Install the headset cups with a HEADSET PRESS. Do NOT use a hammer!
4. Pack the bearings with GREASE for lubrication, this also prevents the bearings from falling out of the retainer.
5. Put a film of GREASE on the fork crown before pressing on the crown race.
