

# MOUSE FREE

## MAINTAINING A MOUSE FREE RV

The Mouse Free treatment prevents mice from entering your RV through the small holes and cavities found on your RV's undercarriage.

The most common places for mice to gain entry to a unit are through the undercarriage. There are a few other places you need to be aware of.

The Mouse Free treatment **CANNOT** prevent entry in the following situations:

| Entry/Access   | Recommendation   |
|--|--|
| A door left open.  | Ensure doors or screens are closed.  |
| The power supply compartment improperly sealed shut.   | Ensure door is closed and any hole around cable is filled with steel wool. |
| Storage compartment left open.   | Close the door.  |
| Parking too close to tree branches. (Mice travel across branches to gain access to the roof and A/C unit). | Maintain a minimum distance of 48 inches from all overhead tree branches.  |

PLEASE ENSURE THE ABOVE RECOMMENDATIONS ARE FOLLOWED.

**"RVing should be stress-free,  
worry-free and of course...**
