# 1. General advises

## 1.1 Introduction

This booklet contains the necessary instructions for a correct installation, running test, normal use and maintenance of the pump as well as practical suggestions for safe operating.

The knowledge of the following will give trouble free operation for a long time.

It is recommended to:

- read and apply closely the instructions before running the pump.
- keep the booklet at hand and have it known to all operators.

## 1.2 Request of spare parts

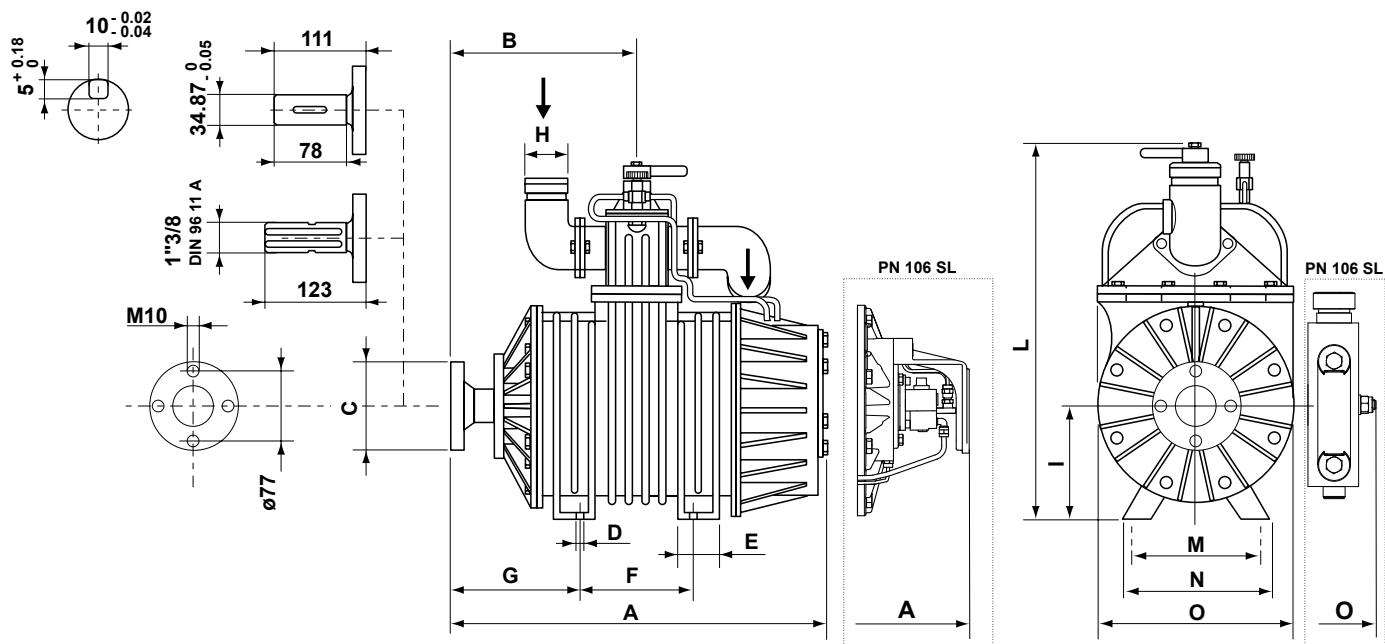

To avoid mistakes when ordering the spare parts make sure you indicate:

a) the model of the pump	See pump label	a) PN 106 M
b) the serial number of the pump		b) X50012
c) the denomination of the part	See spare parts list	c) Rotor vane
d) the number of the pieces		d) N° 4 pieces
e) the code of the part		e) 16016.010.00

Example:

### 3. Safe operating and accident prevention

#### 3.1 General suggestions

- Ordinary and extraordinary maintenance has to be done while the unit is stopped and the drive disconnected.
- Interventions on pneumatic plants have to be done after disconnecting pressure/vacuum from the same.
- Never start the pump if adequate/foreseen safety devices are not installed.  
Damaged protections must be immediately replaced.
- Be aware that during operation the pump's body can reach temperature of over 60° centigrade.  
Possibility of burnings if this warning is missacted.

Maximum speed shown in the technical specifications tables must not be exceeded.

#### 3.2 Normal use

- Vacuum pumps of the PN-series used for the suction of liquids are foreseen for a max pressure of + 1,5 bar (2,5 for "FL" model) and a max vacuum rate of 92 %.  
As cooling is given by atmospheric air, pumps are foreseen for

non-continuous duty; suggested uninterrupted working-time: about 15 minutes (free air).  
Overheating of the pump will cause serious damages of the same and/or blocking of the rotor.

## 4. Installation

### 4.1 Checking at arrival

- upon receipt check that the pump and related accessories are not damaged.
- Check that the rotor/shaft is not blocked.

### 4.2 Pump mounting / Drive connection

- The pump must be installed so that it is easily accessible for inspection and maintenance.
- The vacuum pump must be installed on a rigid base or stand. The drive can be by cardan shaft, belts and pulley or by hydraulic motor.
- The cardan shaft must be mounted so that it does not create any axial thrust; the inclination of the shaft must not exceed 15° (see fig. 1).

- When using the belts and pulley, the pulley can be mounted directly on the rotor shaft.

The alignment between the pulley of the pump and the driving pulley must be thoroughly checked.  
The V-belts tension must be normal, that means the belts must flex for about 2 cm. under the thumb pressure.

- With the hydraulic transmission the motor must be connected by means of a support and a flexible joint.

The transmission must be protected according to current safety standards (for Europe 2006/42 CEE standards).

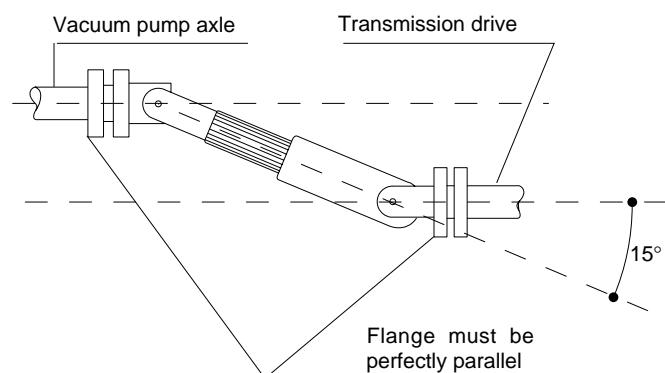

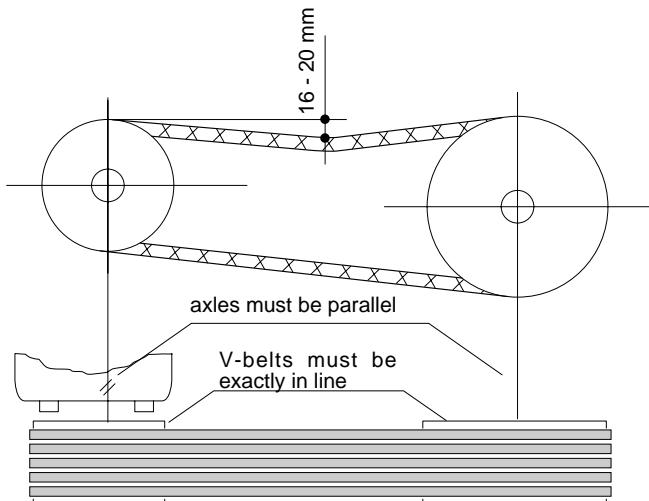

Check that the actual shaft rotation direction matches that of the arrow on the label fixed on the front of the pump.

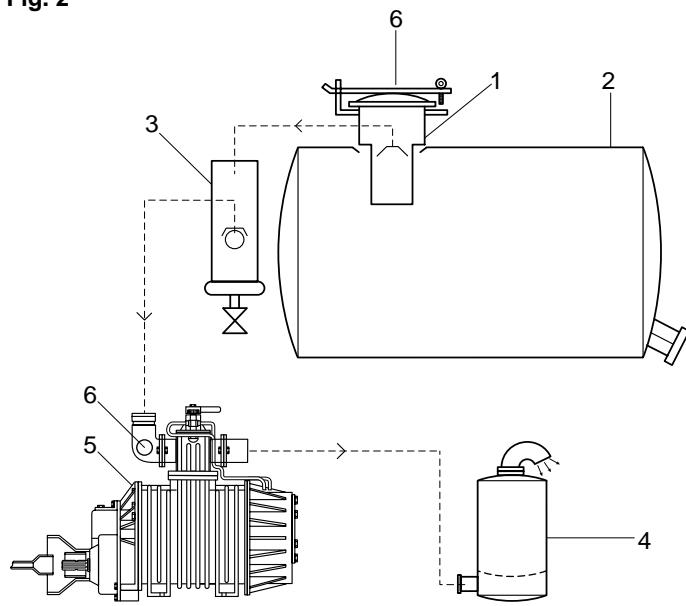

**Drive by belts and pulleys:** the pulley has to be mounted on the «tapered shaft».  
Proceed as indications of fig. 6-7.

Fig. 1

#### 4.3 Layout of vacuum line

**Fig. 2**

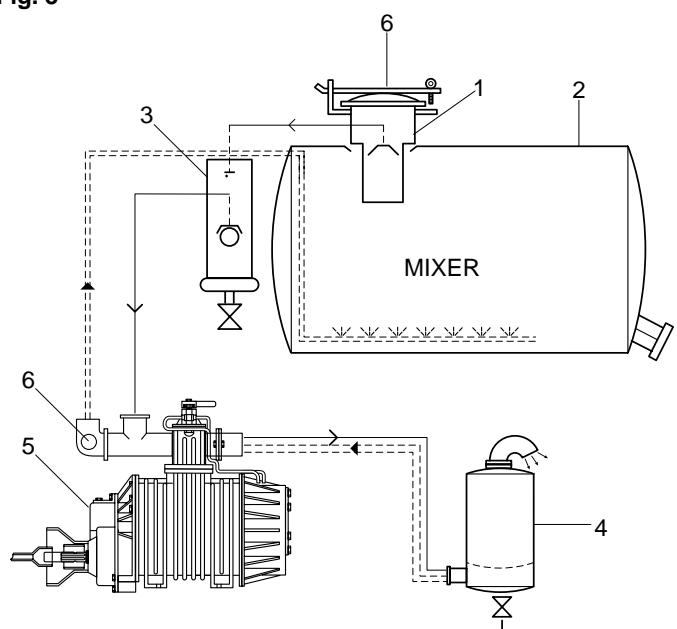

**PN PUMP WITH STANDARD MANIFOLD**

**Legend**

- 1 Primary shutoff
- 2 Tank
- 3 Secondary shutoff
- 4 Silencer + oil trap
- 5 Vacuum pump "PN"
- 6 Safety relief valve

**Fig. 3**

**PN PUMP WITH MIXER MANIFOLD**

- The mounting of a secondary shutoff (pos. 3) is suggested, in-between the pump and the tank, for protecting the vacuum pump.
- A silencer (pos. 4) is suggested in order to reduce sound level.

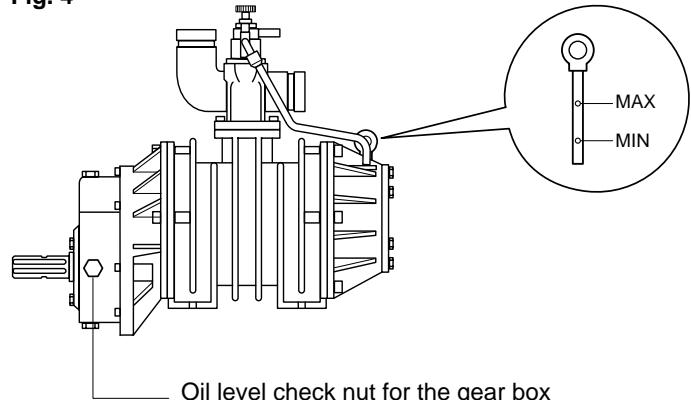

The application of a safety relief valve and a vacuum relief valve on the tank or along the suction line must be foreseen.

## 5. Starting-up instructions

### 5.1 Oil level checking

- Before starting-up the pump, check by the oil dip-stick the level of the oil (fig. 4). If refill is needed only the recommended oils must be used (see par. 2).
- Also the oil level in the gear box must be checked and it must reach the oil level check-nut.

Fig. 4

### 5.2 Lubrication checking

- When the pump is running, check the correct flow of the oil through the sight glasses of the drip oilers (oil drops must flow regularly). In case of oil adjustment, the flow will increase by turning the

adjusting pin on the drip oiler counterclockwise and will decrease by turning it clockwise.  
For oil consumption see paragraph 2.

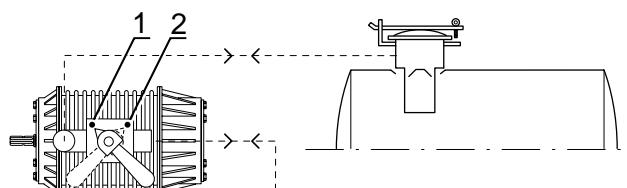

### 5.3 Vacuum / Pressure changeover valve

- Rotating the handle of the 4 way valve (pos. 1÷2 - See following figure) the pump changes over from vacuum to pressure (or viceversa).

As the pump can be connected to the vacuum tank with both the front (drive side) connection or the rear (oil tank side) connection in order to avoid mistakes see the following table "Vacuum-Pressure"

Manifold	Drive	Handle pos.	Pump function	Connection to the tank
Standard	Direct drive Left	1	Pressure	
	Gear box Right	2	Vacuum	
	Direct drive Right	1	Vacuum	
	Gear box Left	2	Pressure	
Mixer	Direct drive Left	1	Vacuum	
	Gear box Right	2	Pressure	
	Direct drive Right	1	Pressure	
	Gear box Left	2	Vacuum	

- JUROP pumps are normally assembled to be connected to the tank by the front connection (see fig. 2-3 page 8).

- **Left** hand drive means counterclockwise rotation and **Right** hand drive means clockwise rotation, looking at the pump from the shaft side.

In case the pump is connected to the tank with the rear connection (oil tank side) the functions "Vacuum - Pressure" will be reversed.

Be aware not to place the handle in neutral position (half way between the two end positions) otherwise the pump will be bypassed (actually runs idle)

## 6. Maintenance

### 6.1 Ordinary maintenance

- a) Re-fill periodically the lubrication oil tank.
- b) Change at least once a year the oil in the reduction-box and/or gear-box (see chart at point 2).
- c) Clean the sight-glasses of the drip-oilers.
- d) Check that the drive protections are properly fixed.
- e) On direct-drive models grease the front ball-bearing (see pos. 1 fig. 6-7-8).

### 6.2 Extraordinary maintenance

Changing of the sliding-vanes:

- a. Remove the front flange as shown in fig. 6-7 and 8.
- b. Lubricate the new vanes and insert them after removal of the old ones.

- c. Replace all the gaskets and seals (ask for the suitable "Gasket Kit").

## DISASSEMBLY OF PUMPS

Fig. 6-PN 45÷106

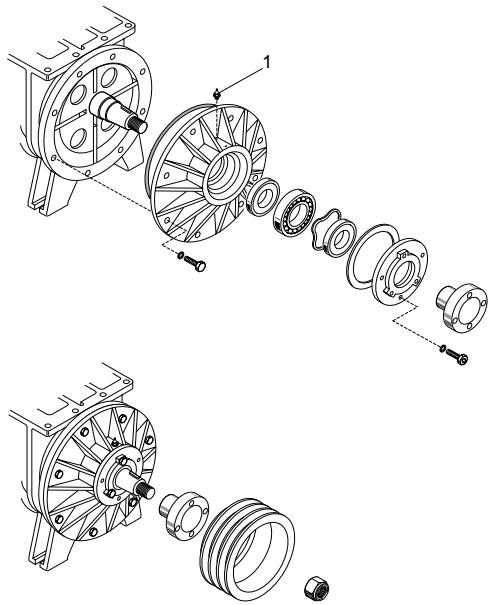

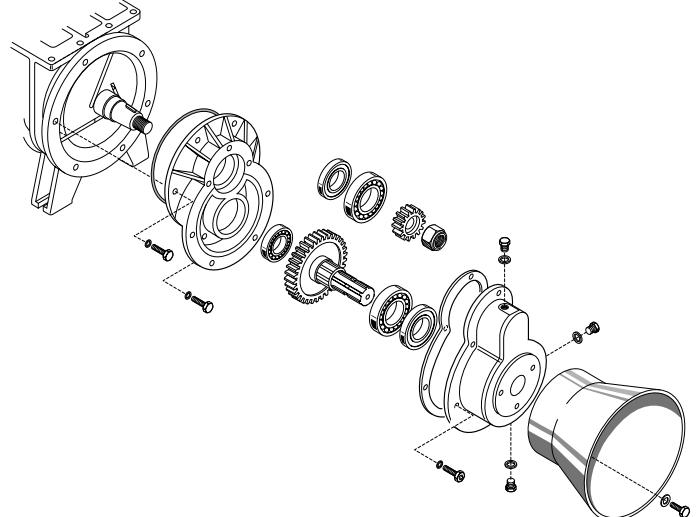

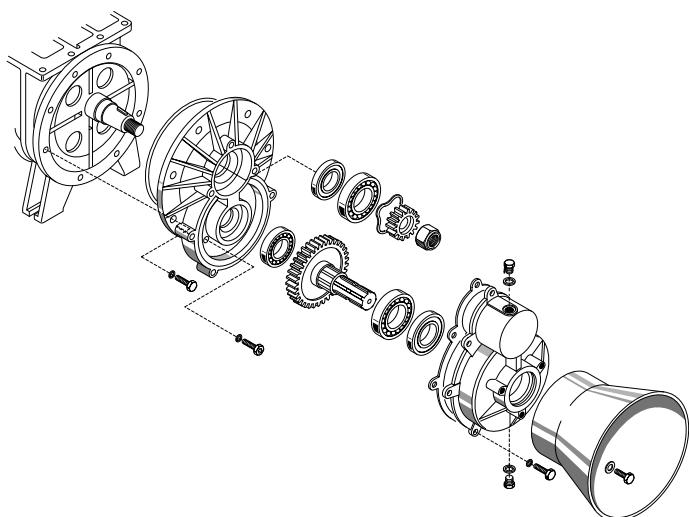

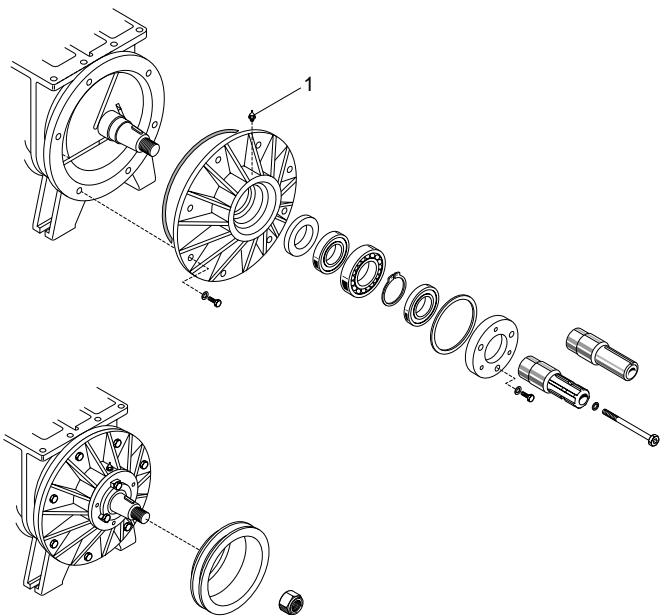

Fig. 7-PN 23÷33

## 6.3 Trouble-shooting

### Troubles

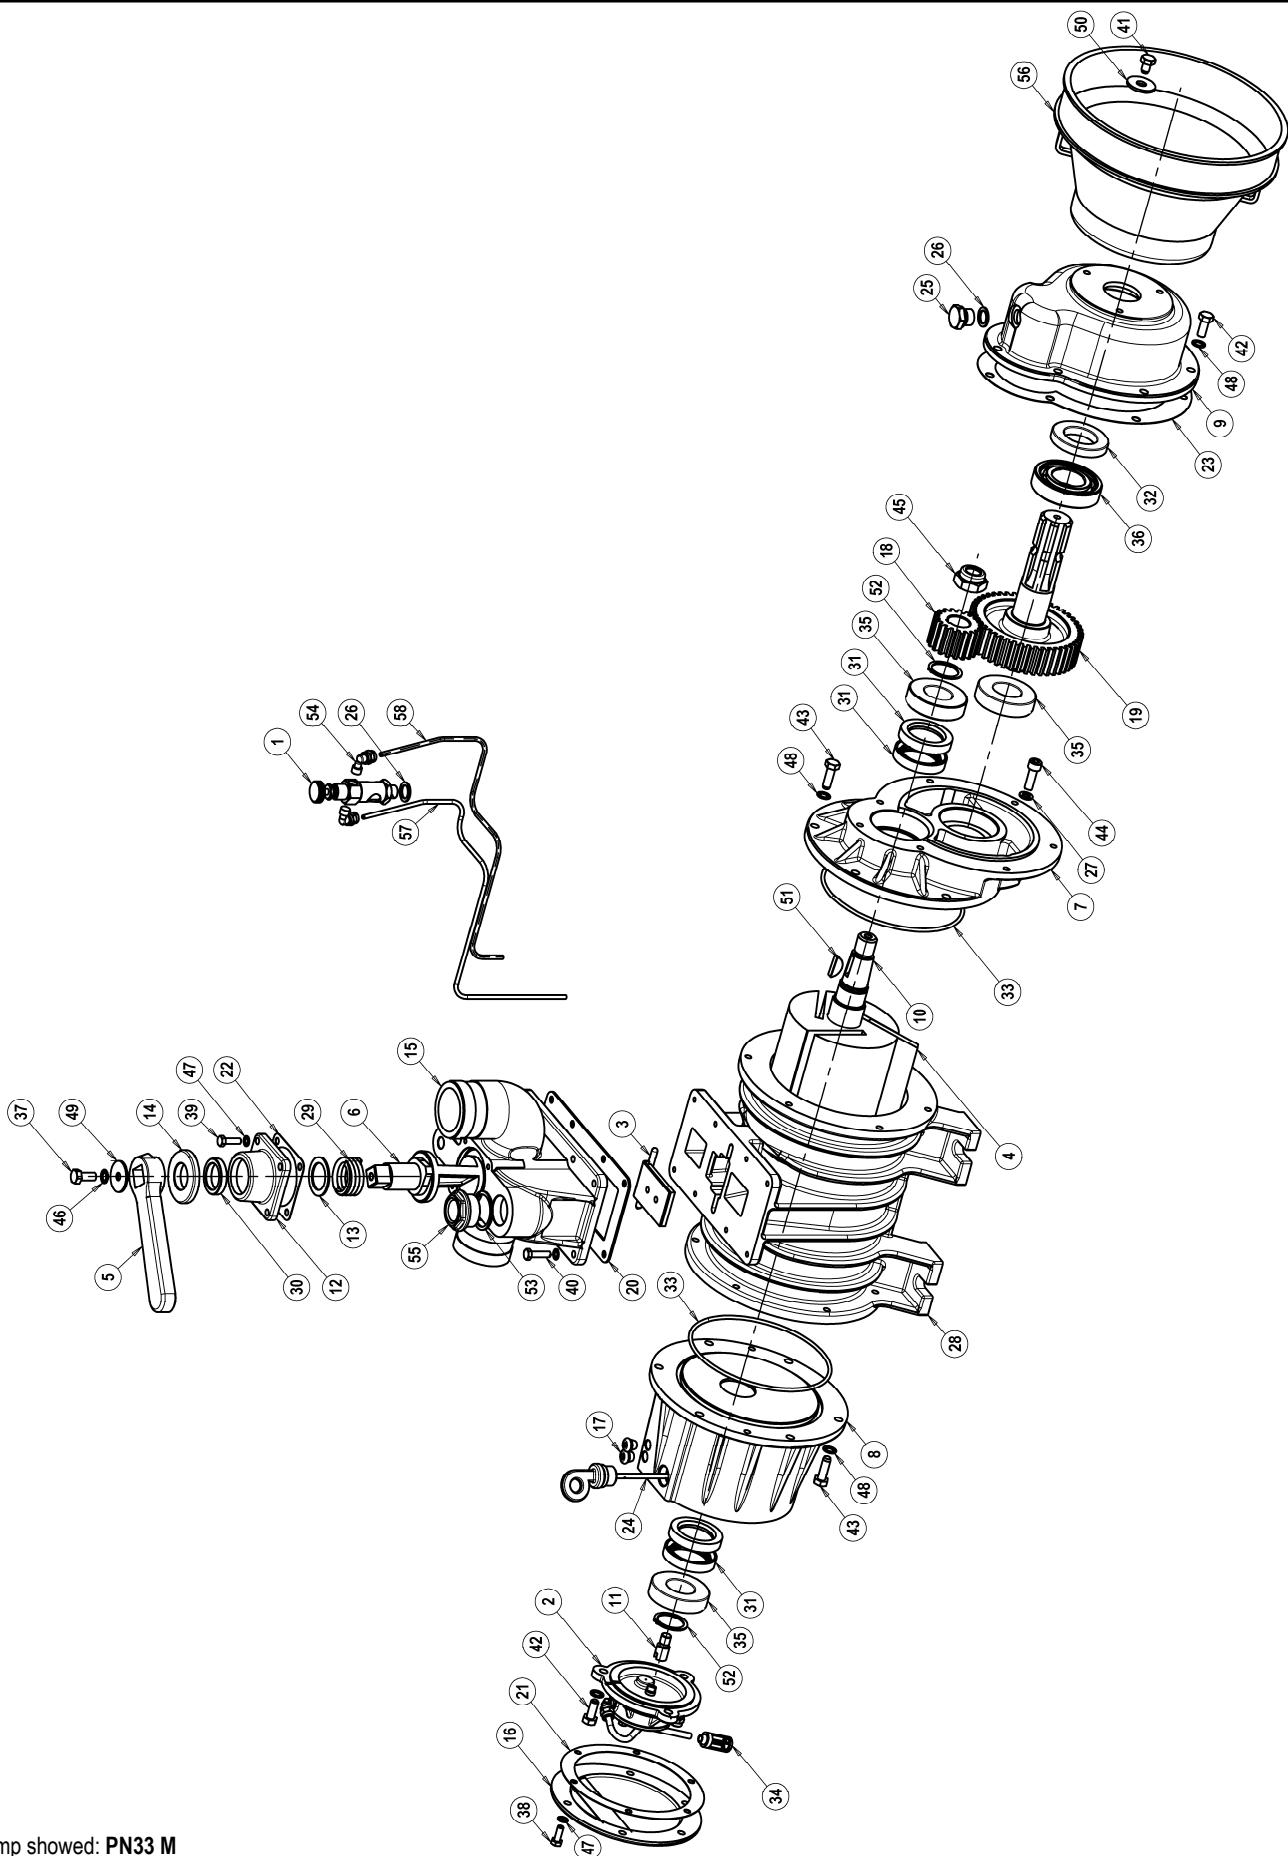

<b>A - Overheating of the pump</b>	
CAUSE	CORRECTION
- Faulty lubrication	- Check the lubrication
- Oil missing	- Re-fill the tank
- Revs. to high	- Reduce revs.
- Operation-time to long	- Stop the pump for a while and let it cool down or operate at lower vacuum rate
<b>B - Pump consumes too much oil</b>	
CAUSE	CORRECTION
- Drip-oiler/s badly adjusted	- Adjustment as described
- Oiler's pin not sealing	- Clean the related seat
<b>C - The pump is blocked</b>	
CAUSE	CORRECTION
- Broken vanes due to suction of foreign objects or bad lubrication	- Dismount the pump and replace damaged parts. Check primary shut-off and lubrication system.
- Frozen pump	- Unfreeze the vacuum pump
- Damaged drive system	- Check and replace damaged parts
- Flange bolts too tight	- Loosen the bolts

---

**D - Little or no vacuum or pressure in the tank**

CAUSE	CORRECTION
- Change-over lever in neutral position	- Place lever in right position as shown at point 5-3.
- Worn sliding-vanes	- Replace the vanes
- Loose check-valve	- Replace the valve
- Worn sealing rings	- Replace the rings
- Blocked vacuum pump	- See previous instructions
- Leaking of the gate-valves on the tank	- Tighten the valves
- Leaking of the seals	- Repair or replace the seals
- Primary shut-off blocked	- Dismount and clean the parts
- Clogged connecting pipeline	- Clean the steel pipelines or replace the rubber ones
