..... NOBLE SKIN CARE

Pixel - Fractional Skin Resurfacing and Skin Tightening

Fractionated Pixel laser is notably popular due to the natural appearance of the skin after a treatment. We equate it to a magical wand, softly erasing and buffing skin imperfections with the most natural appearance. It reduces the appearance of fine lines, mild to moderate wrinkles, overall skin laxity, sun damage, rough textures, enlarged pores, and acne scars. Pixel is a non-ablative fractionated system that works deep in the underlying tissues.

How Does Pixel Work?

Pixel works by creating micro-perforations into the skin. As a result, you will see the effects of increased collagen production (improved wrinkles, laxity, smooth skin, smaller pores and corrected damage).

What can I expect during treatment?

Treatment is generally considered to be well tolerated and almost pain free, with a light “flicking” feeling on the skin as the laser is fired, and some sensation of warmth is felt during treatment. The treatment of deeper wrinkles and scars may produce more discomfort and heat effect. Treatment is described only as a mild heat sensation with no real pain by most patients.

What can I expect post treatment?

One of the remarkable benefits of having Pixel, is that the downtime is really minimal and you can resume your lifestyle within a day. Post-care really has evolved and allow for better healing and exfoliation without noticing much of it as the skin continues to exfoliate. Within 5-10 days, skin will appear resurfaced, renewed, tighter, brighter and the correction of targeted damaged such as acne scars, lip lines or other notable concerns will be improved after one treatment. Pixel is best in a series of 3-6 treatments and continues to deliver cumulative results months after.
