

# Drip Filter Machine

Automatic Drip Filter coffee machines use baskets which you fill with ground coffee. Some machines require you to fit a paper filter in the basket, whilst other have a mesh filter. The machine heats the water and pours it through the coffee, brewing into a carafe at the bottom of the machine.

1. Fill the water reservoir with filtered water.
2. If necessary, add a filter paper to the basket. Add medium ground coffee to the basket. Add approximately one tablespoon of ground coffee for every cup of coffee.
3. Ensure the carafe is placed in the machine and turn it on.
4. The water will heat up, flow through the coffee grounds and into the carafe. When no more coffee pours out, it's done.
5. Some drip filter machines have a heating plate under the coffee pot which will keep your coffee warm. Be aware if you leave it too long it may become bitter.

NOTE: Please follow the instruction manual that came with your machine for exact method.
