LED Medicine Cabinet Installation Instructions – Flush Mount

Use these instructions if your medicine cabinet is a flush mounted medicine cabinet. If you have a surface mount medicine cabinet, please see the following link: <https://www.mirrorsandmarble.com/blogs/mirror-tips/surface-mount-medicine-cabinet-installation-instructions>.

PLEASE BE CAREFUL removing the medicine cabinet from the box. Use Goof-Off (original squeeze can, not spray) to remove any residue on the frame. Use ammonia-free window cleaner to clean the mirror areas. Also carefully remove the 3 glass shelves and mounting hardware.

Opening Preparation

1. All flush LED mount medicine cabinet sizes require a rough opening of 3/4 inch smaller than the size of the cabinet in width and height. For example, a 24x32 inch medicine cabinet would have a rough opening of 23.25 inch by 31.25 inch. This opening should have wall studs adjacent to each side of the medicine cabinet to allow securing the medicine cabinets to the wall studs.
2. The power connection to the LED medicine cabinet is approximately 2-3 inches from the top of the hinged side of the cabinet (*NOTE: For 16x30 size medicine cabinets, the power connection is 2-3 inches from the bottom of the hinged side*). It will be necessary to cut a notch or drill a hole in the wall stud that is adjacent to the power connection - the opening should be large enough to thread the cabinet wiring to connect to the Romex.
3. Make sure that your electrical connection to the LED medicine cabinet is Romex standard house wiring, 14/2 or 12/2 from a **standard** light switch (connection to light switch is optional if your mirror has an integrated switch). A dimmer wall switch will not work with our medicine cabinet LED. The cabinet also has a built-in switch so a wall switch connection is not necessary.

Cabinet Preparation and Installation

1. If you are trying to install the medicine cabinet with only one person, we recommend carefully removing the mirror door from the cabinet before mounting, and placing on a soft, protected surface. This will make the installation much easier, and prevent possible damage to the mirror. *Please be very careful removing and replacing the screws securing the door to avoid stripping the threads.* If you leave the door attached, it is important to have two people doing the installation to allow one person to hold the door open while the cabinet is being secured to the studs.
2. You will find three holes centered on each side of the medicine cabinet frame that will be used to secure the medicine cabinet to the studs when you slide the frame into the hole cut into the wall. These holes will have white plastic plugs in them which you will first remove. Please do not remove or lose the white plugs used to fill the holes for the alternate locations of your shelf mounting clips.
3. Carefully slide the medicine cabinet into the rough opening so that the “lip” of the front of the medicine cabinet is pushed flush against the rough opening, making sure that the medicine cabinet is “level”. Secure the medicine cabinet to the studs using the provided anchor screws. The provided anchors are not necessary if you are screwing directly into wood studs.
4. Before connecting the electric, please turn off power to the circuit at the circuit panel. The Romex would be attached to the medicine cabinet wiring Black to Black, White to White and Green to Ground.
5. Once the cabinet is installed, re-install the cabinet door and install the glass shelves.
