

# PRO TIPS

Store henna cone in freezer to keep paste fresh. Will last for 3 months.

When ready to use, defrost cone for 20 minutes, then wipe off condensation. Remove needle and you're ready to begin!

Best to shower before henna application. Will help to minimize your tattoo's exposure to water and allow it to develop properly.

The longer you leave on the henna paste (up to 24 hours), the darker your stain will be and the longer it will last.

For the darkest stain, apply paste to areas with thick skin such as palms of hands and feet.

If using a stencil, cut sticker to size and press firmly on desired area. For parts of sticker not sitting well, cut slits to allow it to bend and lay flat on the skin. Next get in a comfortable position, fill in stencil with a layer of henna paste and let it dry before moving too much.

For best results keep area with your tattoo still for 30 minutes while your paste dries to a crackly state. Once dry, leave on for at least another 2 hours for good color. If a longer time is desired, you can use cling wrap to protect and leave on thru the night.

Once time has elapsed, use coconut oil and paper towel to remove dried henna. Do not use H2O! Avoid getting water on your tattoo for at least 5 hours after. The color will continue to intensify for up to 24 hours.
