

THE DIFFERENCE IN QUALITY

Economy or Premium

The Premium range is made of anodised Aluminium which is stronger than the Economy range steel doors and tracks and can be used in all internal environments unlike steel systems which we would not advise be used in or adjacent to any areas of humidity.

The Premium range is gasketed providing a buffer between the glass and the metal resulting in a stronger more robust door.

The Premium range has higher specification (ball bearing based) bottom running and top guiding wheels leading to a smoother and quieter run on the tracks.

The tracks top and bottom are also narrower and more sleek in the Premium Range.

Door positioners come as standard in the Premium range and are not available in the steel system.

These give the doors a positive closure.

Each door in the Premium Range has a rebated soft brush edging strip for quieter closure against each other or wall.

Steel Economy doors are a high value steel system but without all those benefits listed above in the Premium range.

Its like two cars of a different classification – a Jaguar or a Fiesta. Each gets from A to B and works well in different ways and is a different price reflecting the perceived qualities/value.

I hope this is of help to clarify the major differences and benefits and if you have any further questions please don't hesitate to ask.
