

IDENTIFYING BITE MARKS

PEST BITEMARKS WILL PINPOINT THE PERFECT TRAPPING SITES

Goodnature RODENT DETECTOR CARDS identify pests by their unique bite marks.

RATS and MICE are meticulous nibblers. They will often focus on one area, occasionally removing some plastic. A longer jaw length allows rats to mark further into the DETECTION SURFACE from the edge than mice.

HEAVY INTERACTION – The key difference between rat and mouse bite marks is that mice have small teeth and jaws that leave very fine marks with a neat finish. Conversely, rats leave a rougher finish and you may see confetti-like litter beneath the card on the ground. Rats can also completely destroy the card with their gnawing.

OTHER BITE MARKS YOU MIGHT SEE

HEDGEHOGS (which are also a predatory pest) have sharp canines and will leave pointed, clumsy bite marks on the DETECTION SURFACE. The A24 is effective for trapping hedgehogs.

POSSUMS have two large front incisors in their upper and lower jaws. With aggressive behaviour they scratch large areas of the DETECTION SURFACE and even bend the DETECTOR CARDS.

If you detect possums you need the Goodnature A12 multi-kill possum trap. The A24 trap will not kill possums.

NO RODENT INTERACTION - Either rodents are not present at this site or it is located where they will not interact with the lure and device. Try waiting a few more days or moving the card to a different location.
