

Habitat 2.4/3.4 Mounting instructions

This is the mounting slot.
It allows the device to hang in four different directions.

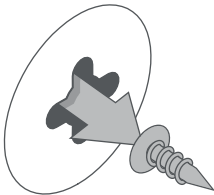

In order to work correctly, you will need a screw with a head that will fit into the center opening.

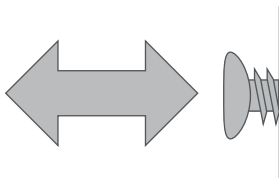

Drive the screw into the desired mounting location.
If the placement is in drywall and not a stud or solid wood location, you may want to use an anchor for support.

Leave approximately 1/8 to 1/4 inch of the top of the screw standing out from the mounting surface as shown.

Align the mounting slot over the head of the screw and insert the two together by pulling the device downward to lock in place.

The screw may need to be adjusted to hold the device.

If the device is loose, tighten the screw further into the mounting surface and remount the device until it is snug.

If the screw is in too far, the device may not fully insert. In this case, loosen the screw and remount the device until it is snug.
