NAKAKITA SAFETY-RELIEF VALVES

CAT.No.526-3E

Preface

- With concentrated efforts, by constantly developing new techniques, furthering quality assurance of improved products and making it our motto to produce safety valves which guarantee full satisfaction of every customer, Nakakita vigorously has been striving toward safety of various plant facilities .
- As a ministerial certification holder to produce valves for High Pressure Gas Security Law and a certified manufacturer of ASME Code stamping, together with its acquisition of international standard of ISO 9001, Nakakita's quality control system has highly been recognized worldwide and hence its remarkable production increase of approved valves.
- Safety-relief valves introduced herein have widely been installed in every industrial field for all types of gas, vapor, steam and liquid, and contributing to device safety. These valves are basically designed in compliance with such international standards as API, ASME, etc. In addition, they are all in full compliance with such related domestic laws and rules as those of Ministry of Economy, Trade and Industry (High Pressure Gas Security Law and its Related Rules , Electric Power Industry Law, (Technical Standards of Nuclear and Thermal Power Generation) and Gas Industry Law), Ministry of Health, Labor and Welfare (Structural Standards of Boiler and Pressure Vessel), and other marine related rules, etc.
- We sincerely do hope this new catalog covering full description of Nakakita's safety-relief valves will give you complete satisfaction for your plan of technical innovation and safety security for your entire plant .

	CERTIFICATE OF AUTHORIZATION
This certificate accredits the named company as authorized to use the indicated symbol of the American Society of Mechanical Engineers (ASME) for the scope of activity shown below in accordance with the applicable rules of the ASME Boiler and Pressure Vessel Code. The use of the Code symbol and the authority granted by this Certificate of Authorization are subject to the provisions of the agreement set forth in the application. Any construction stamp placed on this symbol shall have been built strictly in accordance with the provisions of the ASME Boiler and Pressure Vessel Code.	
COMPANY: Nakakita Seisakusho Co., Ltd. 1-1 Fukonominnami-machi Daito-City 574-8891 Osaka Japan	
SCOPE: Manufacture of pressure vessel pressure relief valves at the above location only	
AUTHORIZED: April 6, 2006 EXPIRES: April 6, 2009 CERTIFICATE NUMBER: 25,505	
<i>R. S. Johnson</i> Chairman of The Boiler And Pressure Vessel Committee	
<i>Alan Ba</i> Director, Accreditation and Certification

1	Wide Range of Type and Application	Designed to be applicable to various services such as gas, vapor, steam and liquid from high pressure and temperature to cryogenic condition.
2	Precise Operation	Well-balanced operational function of safety valve, its most vital performance (opening and closing) under any service condition, designed by most updated technical innovation.
3	Assured Capacity	Structured by less pressure loss body, and its relieving capacity is assured by the National Board of Boiler and Pressure Vessel Inspectors in accordance with ASME code Section VIII.
4	Positive Tightness	Assured tightness materialized by the special seating surface on disc and nozzle finished by Nakakita's unique lapping scheme. Due consideration given to shape and structure of disc for complete prevention of seat leak due to thermal distortion for high temperature service.
5	Easy Maintenance	Simple lapping with flat seat of disc and nozzle so as to always maintain initial conditions. Another easy maintenance with interchangeable components worked by NC machines.
6	Excellent Quality	High quality safety valves produced by well-established design technique under a rigorous quality control system (ISO9001, ASME V&UV and High Pressure Gas Security Law), hence resulting in great amount of increasing delivery.

2-1 Application Range

Each valve's applicability for various fluid in view of structure and materials are tabulated below. Please use it as your reference of type selection.

Type	Type Application Index									Material Application Index							ASME Code Section VIII	Page				
	Saturated Steam	Superheated Steam	Air	Gas	Vapor	Liquid	Water	Oil	Dowtherm	Corr. Gas & Vapor of Hydrocarbons	Non-Corr. Gas & Vapor of Hydrocarbons	Corr. Liquid	Non-Corr. Liquid	Caustic	Acids	Extreme Corr. Service	Cryogenic Service	Chlorine	Ammonia

Note : In the blank, □, sub-codes showing type of cap or lever on the table below are put .

* Please refer to page 10 for special materials .

2-2 Type Designation

Types of safety-relief and relief valves listed in this catalog are as follows :

BAS-CODE	SUB-CODE	Description
NS 255		Full nozzle safety-relief valve designed for general application. Pressure, temperature and fluid are in wide range and most common for process purpose. Standard is flanged connection. Socket and butt welding connections also available.
NS 200JMR		Without adjustment, small and simple structure, basically designed for thermal relief of pipe and pressure vessel. Standard is screwed connection. Flanged and socket welding connections also available.
NS 256 *		Full nozzle pilot type safety valve. Extremely small pressure differential between operation and set pressure. So applied for narrow adjustment of valve's basic function (opening and closing performance) within its small differential. Standard is flanged connection. Socket and butt welding connections also available.
NS 255□L		Applied for overpressure protection at pump's outlet. Relief valve for liquid to obtain proportional valve lift against delivery pressure. Standard is flanged connection.
A		Screwed cap (standard)
	C **	With regular lifting lever (pull-up type)
	D	With packed lifting lever (pull-up type)
	M **	With air lifting motor
	L **	With packed lifting L lever (pull-down type)
	R **	With packed lifting R lever (pull-down type)
	C **	With adjusting valve furnished on bonnet against back pressure. Applied only for the occasion when minute adjustment is required for blowdown.
b **		Balanced bellows : applied against built-up and variable back pressure, and corrosive fluid . (conventional type is without code.)
	X **	Flexible disc : applied for complete prevention of seat leak due to thermal distortion and it provides superior tightness against dowtherm and high temperature fluid.
	S **	Super disc : applied for further prevention of seat leak in such case as above flexible disc can not cope with harder situation.
-E		General application type safety relief valve with its 10% enlarged orifice area against conventional 255 type.
	*	: This type is without sub-code.
	**	: NS 200JMR and NS 255□ L type are without sub-code .

2-3 Flange and Flange Facing

- a) Standard is JIS pipe flange or ASME flange.
- b) Standard of ASME flange comes with RF and serration is not given unless any special request, and when it's done, spiral is standard.

2-4 Valve Trim

Trim area is nozzle and disc and its standard material is SUS304 (SUS316 is for orifice D&E).

2-5 Balanced Bellows Type Safety-Relief Valves

- a) Balanced bellows type is recommended against back pressure outbreak exceeding 10%, variable back pressure and corrosive fluid.
- b) Standard material is SUS316L. Other materials available on your request.
- c) Average back pressure limit is 0.4 MPa. Your instruction needed for higher pressure.

2-6 Low Set Pressure Limit

Orifice	Low Set Pressure Limit (MPa)		
	Conventional (NS 255□-E)	Balanced Bellows (NS 255□b-E)	Thermal Relief (NS 200JMR)

T	0.03	0.21	—
V	0.03	0.21	—
W	0.03	0.21	—

2-7 Cold Differential Set Pressure

It is customary to make some adjustment in the set pressure under atmospheric conditions to compensate for the effect of the operating temperatures. The following table shows the adjustments made in NAKAKITA Safety-Relief Valves.

Operating Temperature (°C)	Increase in Set Pressure at Atmospheric Temperature (%)
—150 and bellow	—1
over —150 to 80	0
over 80 to 150	1
over 150 to 250	2
over 250 to 450	3
over 450 to 650	4

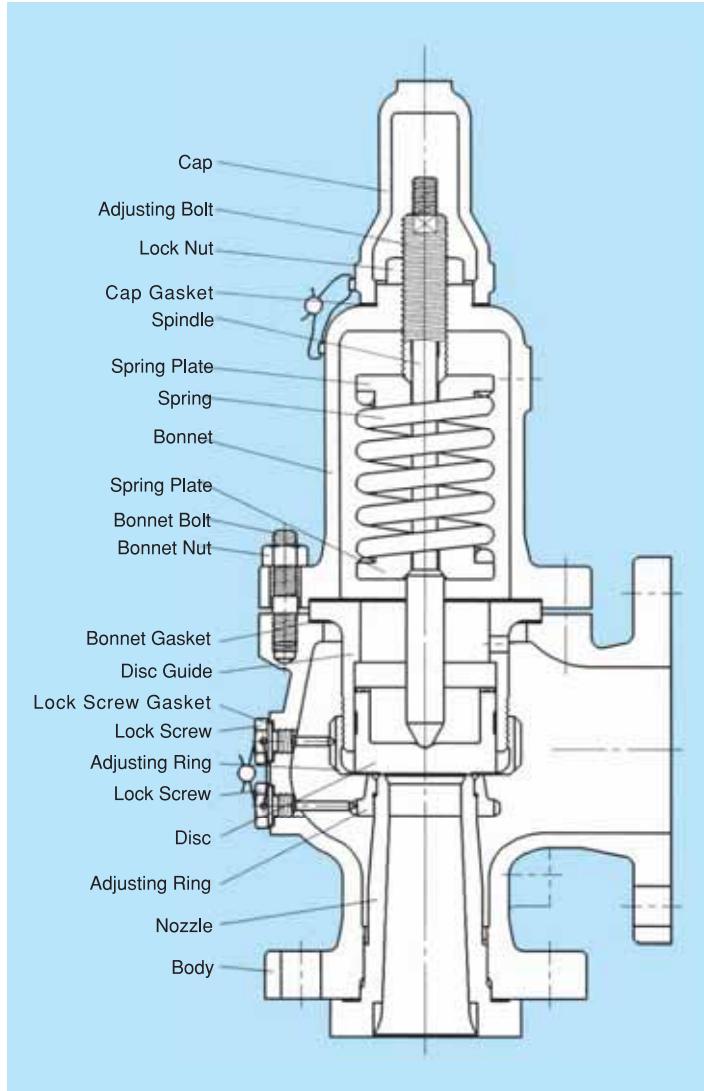

2-8 Differential between Operating and Set Pressures

Appropriate differential between operating and set pressures is required to prevent such troubles as seat leak, hunting, etc.

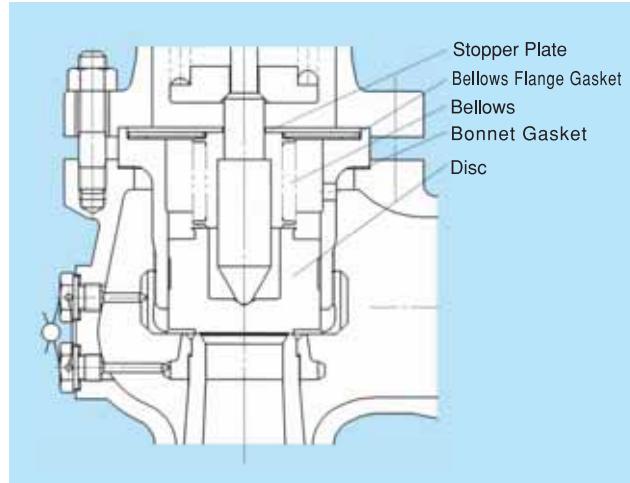

In general, for gas fluid approximately 10% or 0.035 MPa higher set pressure than the operating pressure-whichever is greater, is recommended.

3-1 Structure and Type

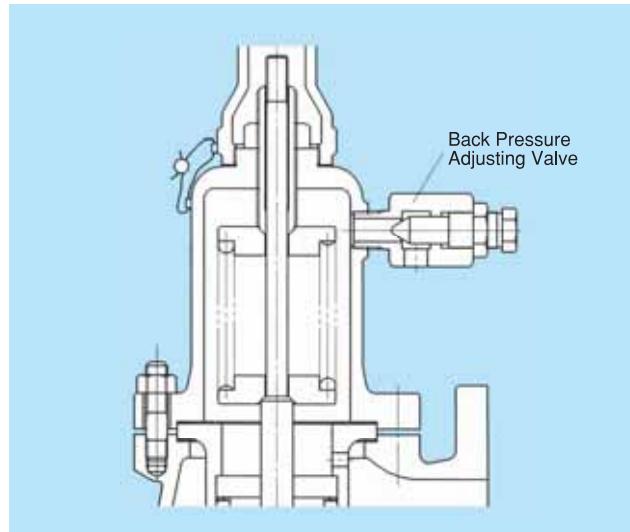

■ NS 255□-E (Conventional Type)

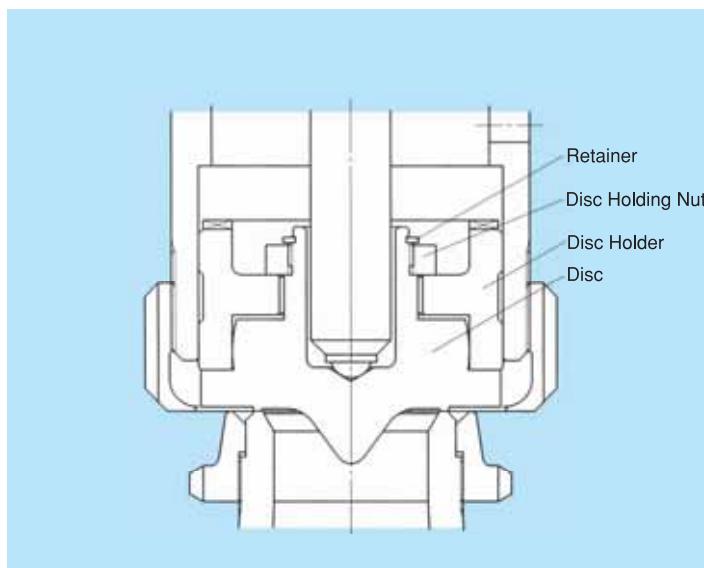

■ NS 255□b-E (Balanced Bellows Type)

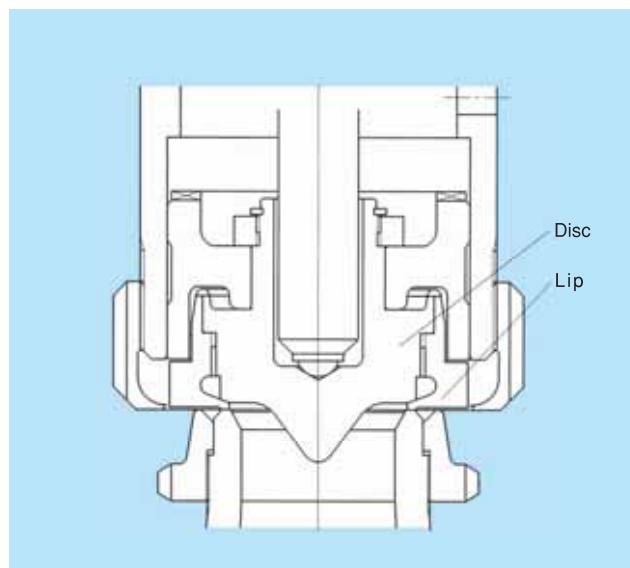

■ NS 255□C-E (Back Pressure Adjusting Device)

■ NS 255□X-E (Flexible Disc)

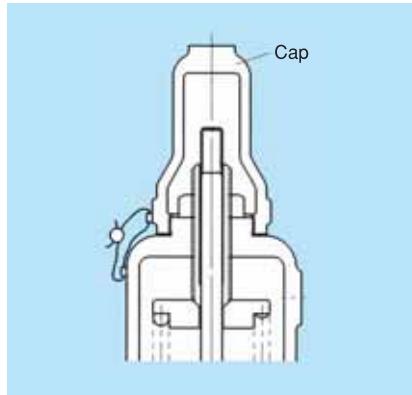

■ NS 255□S-E (Super Disc)

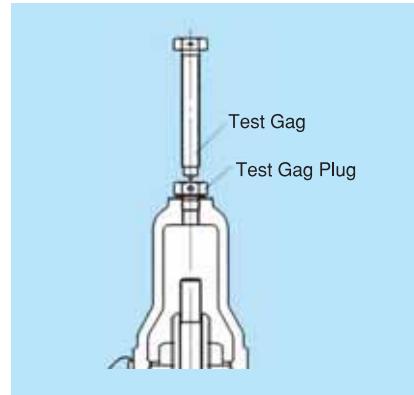

3-2 Cap and Lifting Gear

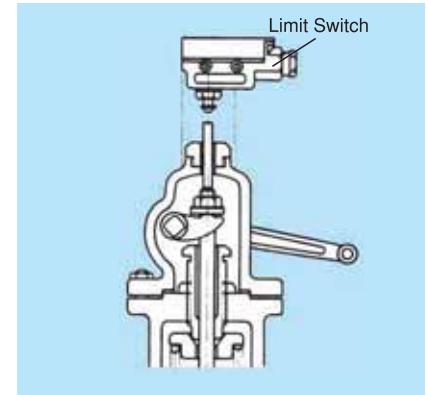

■ Type A (Screwed Cap)

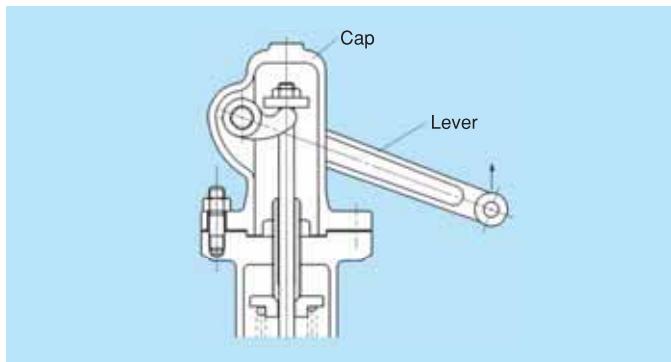

■ Test Gag

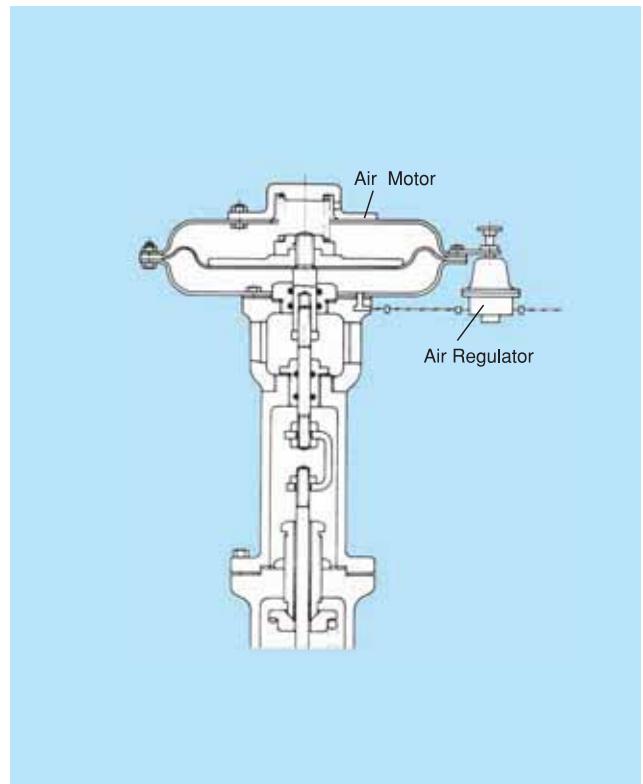

■ Limit Switch

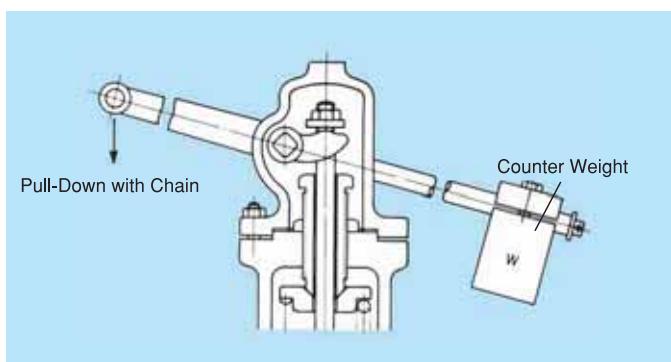

■ Type D (Packed Lifting Lever)

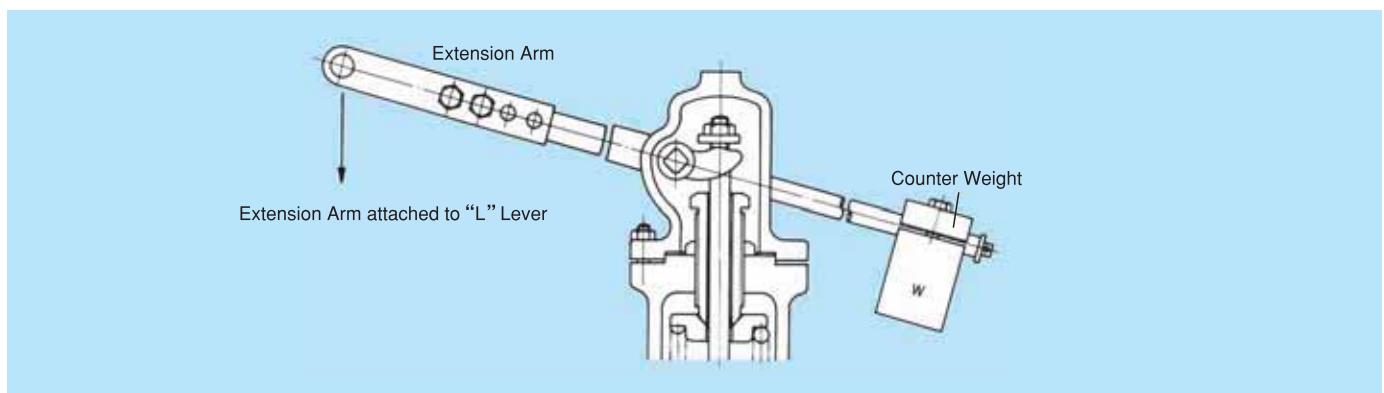

■ Type M (Air Lifting Motor)

■ Type L (Packed Lifting "L" Lever)

■ Type R (Packed Lifting "R" Lever)

3-4 Sizes, Pressure-Temperature Limits, Dimensions and Weights

- The table below shows the pressure-temperature limits (conforming to API STD.526) with ASME flange connection.
For JIS pipe flange connection the pressure limit is decreased depending on its rating.
- Please refer to pages 19 & 20 for pressure limit for low temperature below -29°C .

1) For Screwed Cap (Type A)

2) For Packed Lifting Lever (Type D)

5-1 Structure

5-2 Features

- 2 ~ 4 % blowdown
- No sinner
- No overpressure required
- Size, orifice and center-to-face comply with API STD. 526.
- Conforming to ASME Code Section VIII
- Relieving capacity is assured by the National Board of Boiler and Pressure Vessel Inspectors.

5-3 Sizes, Materials and Pressure-Temperature Limits

The Sizes, orifice and orifice area are tabulated below. For dimensions, materials and pressure-temperature limits, please refer to the information of NS 255-E series (page11-20) as they comply with API STD.526 in same manner as NS 255-E series. However, non-spring structure on main valve of NS 256 series can be set up to the limit of ANSI/ASME rating. In addition, please be careful to temperature limit of o-ring because o-ring is used for several places.

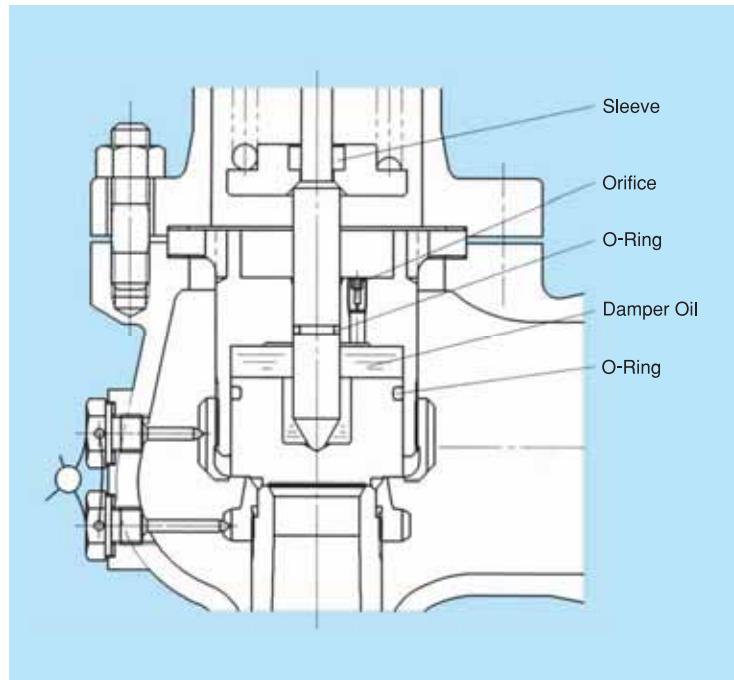

■ Sizes, Orifice and Orefice Area of NS 256 Series

	(mm)																											
Inlet	25	40	40	25	40	40	40	40	50	40	50	50	65	75	75	75	75	100	100	100	100	150	150	200				
Outlet	50	50	65	50	50	65	50	65	65	80	80	80	100	100	100	150	100	150	150	150	150	200	200	250				
Orifice	D		E		F		G		H		J		K		L		M		N		P		Q		R		T	
Area in ² (mm ²)	0.110 (72.3)		0.196 (126.6)		0.307 (198.5)		0.503 (326.8)		0.785 (506.7)		1.287 (834.6)		1.838 (1188.4)		2.853 (1847.4)		3.60 (2324.2)		4.34 (2808.6)		6.38 (4116.8)		11.05 (7133.0)		16.0 (10332.7)		26.0 (16787.4)	

■ Temperature Limit of O-ring

Material	Range(°C)
NBR	0 ~ 70
FPM	-15 ~ 160
MVQ	-50 ~ 180
EPDM	-45 ~ 100

6-1 Structure

6-2 Features

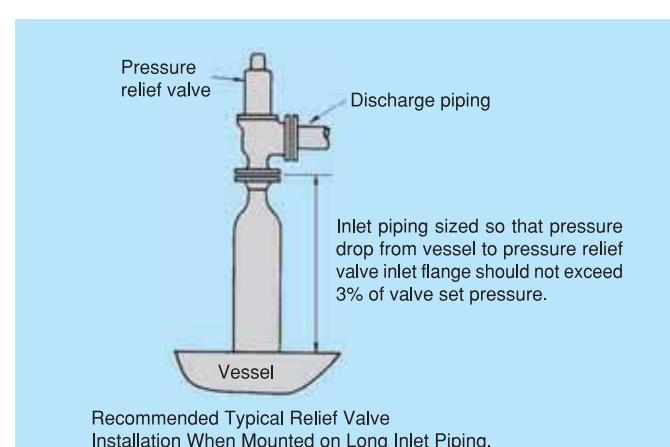

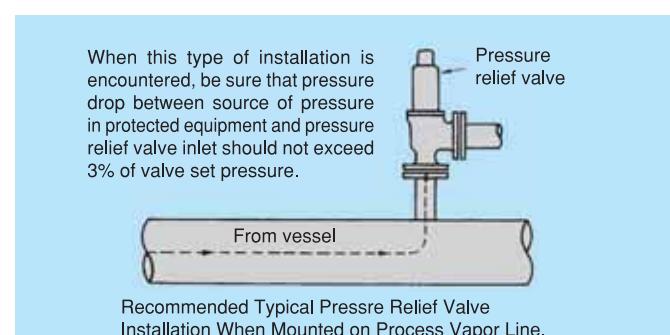

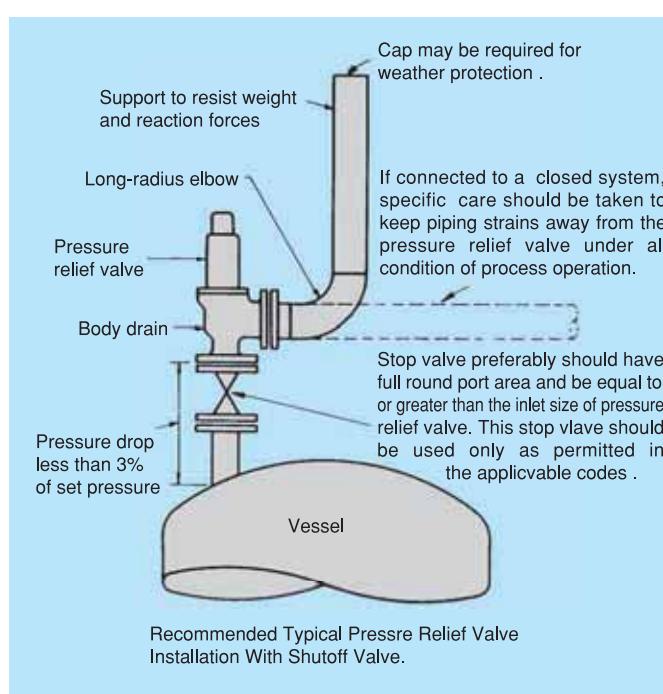

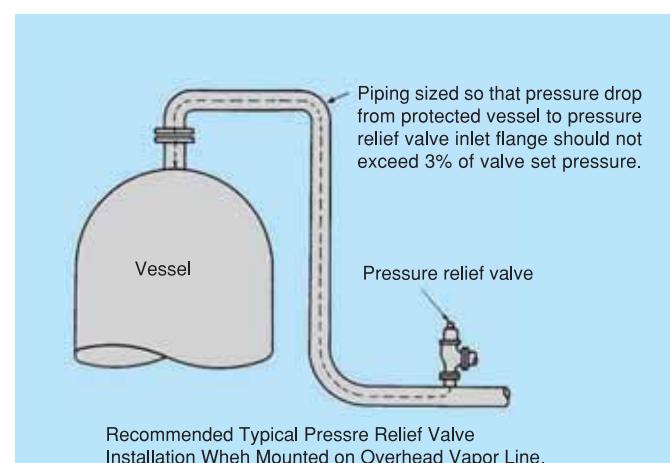

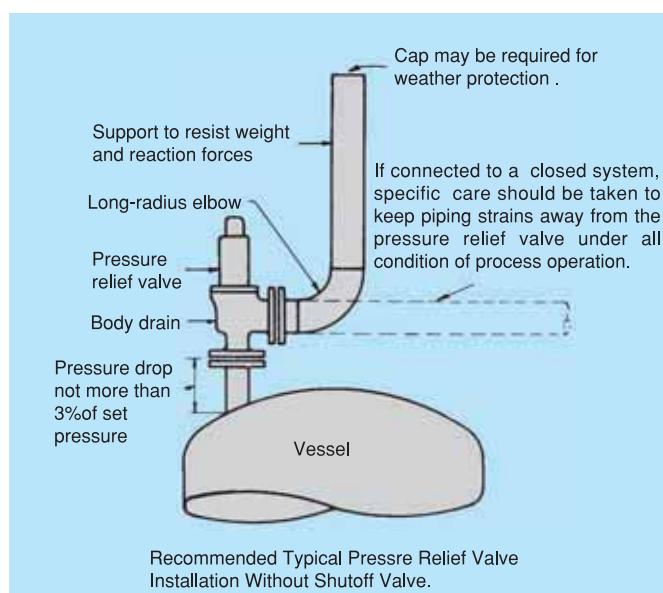

- Suitable for overpressure protection at pump's outlet.
- Speciality of basic performance capable of valve lift in proportion to increasing pressure.
- Orifice furnished within damper room makes soft opening/closing against sudden pressure change at inlet side, and prevents such troubles as chattering, etc. against flow change of fluid.
- Structure is same as NS 255-E Series except for inner parts, and its flow capacity is also same.

6-3 Sizes, Materials and Pressure-Temperature Limits

Derived from NS 255-E series and its size, material and pressure-temperature limits comply with API STD. 526 in same manner as NS 255-E series whose pressure-temperature limits are recommended for your reference. Equipped with O-ring which limits maximum applicable temperature and its material is tabulated on page 22.

For planning an installation of a safety valve (or relief valve), following instructions are recommended :

- In order to prevent chattering of the valve , keep the length of the mount to the minimum so that the pressure drop through the mount does not exceed 3% of the set pressure. The bore of the mount should not be less than the valve inlet bore.
- Pressure drop should not exceed 10% of the valve set pressure.
- Valves should be installed on the places for easy maintenance and adjustment.
- The valve should be set in a vertical position.
- Provide smooth “R” with the inlet approach of the mount.
- The mount should be designed to sufficiently absorb reaction forces and intallation weight.
- The exhaust pipe should be designed so as to keep piping strains away from the pressure relief valve under any condition of process operation.
- The valve inlet , the vessel and pipes all must be thoroughly cleaned before installation .
- Cautions illustrated below are extracted from API RP 520. Please comply with those recommendations for complete operation.

Seat Tightness

Standards on seat tightness are provided in JIS B8210 and API STD. 527. The following is extracted from JIS B8210.

Metal-to-metal Seat Tightness

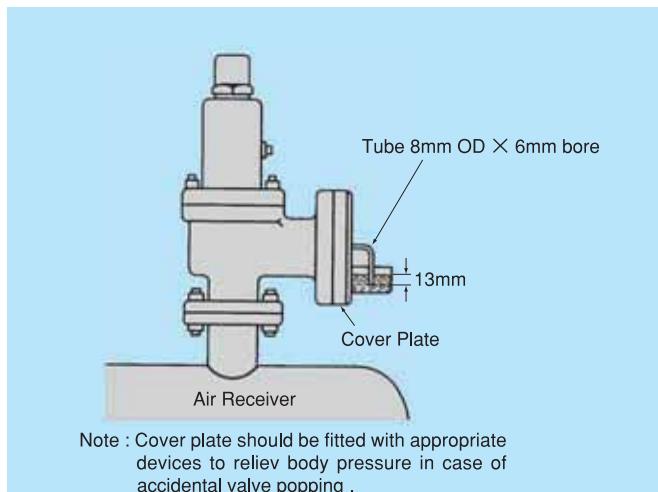

■ Test Apparatus

As illustrated in Fig.8-1, leakage measurement should be made with use of a 8mm-OD tubing with 6mm bore. The tube end shall be cut square and smooth. It should be parallel to and 13mm below the water surface.

■ Test Procedure

As shown in Fig.8-1, with the valve mounted vertically the leakage rate in bubbles per minute shall be determined with the lower test pressure either of 90% of the set pressure or closing pressure immediately after popping. Atmospheric temperature air or N₂ gas shall be used as test fluid and Table 8-1 shows how long the test pressure should be applied before bubble count.

■ Fig.8-1 Test Apparatus for Seat Tightness

■ Table 8-1 Pressure Duration before Bubble Count

Inlet Size (mm)	Duration
Max. 50	1 min.
65 to 100	2 min.
100 & 200	5 min.

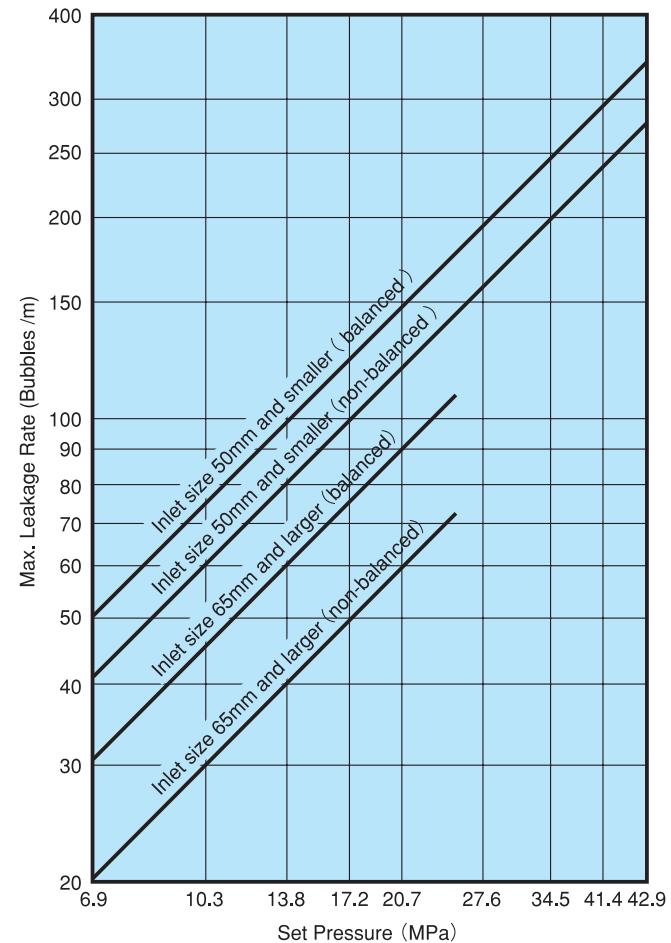

■ Leakage Rate

The leakage rate should not exceed the numbers listed in Table 8-2 when the set pressure is 7 MPa or below, and it should be below in Fig.8-2 when it is over 7 MPa.

■ Table 8-2 Max. Leakage Rate for Valves Set 7 MPa or below

Type	Inlet Size (mm)	Max. Leakage Rate (Bubbles/m)	Converted Leakage Rate (cm ³ /m)
Conventional (non-balanced)	50 and smaller	40	11.80
	65 and larger	20	5.90
Balanced Bellows (balanced)	50 and smaller	50	14.75
	65 and larger	30	8.85

■ Fig.8-2 Max. Leakage Rate for Valves Set at over 7MPa

Full Bore Safety Valve (NS 255F Series)

Safety valve basically for boiler, pressure vessel, various steam tubes, etc. Conformed with ASME Code Section I. Capacity certified by the National Board of Boiler and Pressure Vessel Inspectors.

- Inlet size : 25 to 200mm
 - Connection : flange or welding
 - Pressure limit : Max. 21.4 MPa

Please refer to Cat. No.524.

Feedwater Heating Chamber Low-lift Relief Valve (NS200BF)

- Fluid : water
 - Material : Steel Casting
 - Inlet size : 15 to 25mm
 - Connection : flange or socket welding
 - Pressure limit : 1 to 40 MPa

Vacuum Breaker (NS54D)

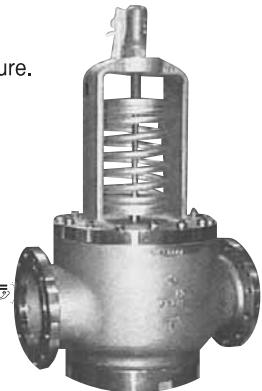

Applicable for storage tanks of petroleum or chemical products to prevent tank destruction caused by operation when inside pressure turned to the vacuum by the thermal change, and to keep atmospheric pressure.

- Inlet size : 20 to 200mm
 - Connection : flange

Special Specification Valve (NS255CX-E)

Dual discharge valve for high temperature.

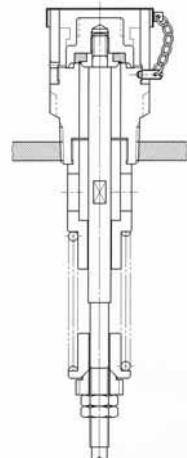

Specia Use Valve (NS200JS)

Relief valve for tank container.

Most vital valve with minimum leakage.

- Fluid : archilalumi
 - Temperature : 20°C
 - Material : SUS 316/Teflon
 - Size : 32mm
 - Connection : NPT1 $\frac{1}{4}$
 - Set pressure : 1.38 MPa
 - Applicable code : Fire fighting laws

GENERAL OFFICE BUILDING

The general office building is the center of our plants for the production of [valves and control systems].

- The lower floor accommodates general offices of General Affairs Dept., Engineering Dept., Quality Assurance Dept., etc.
- The upper floor accommodates Technical Department (Design Section).

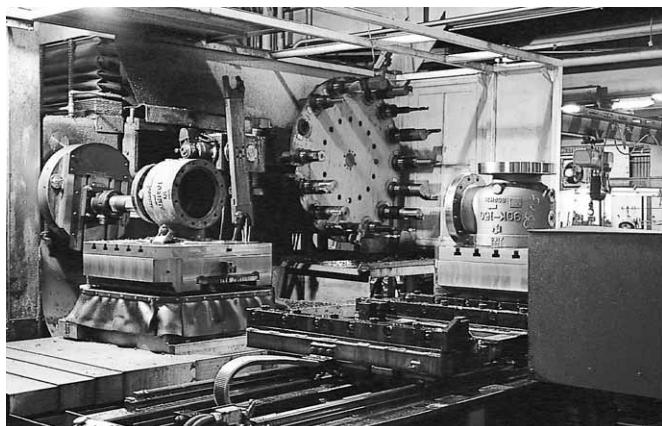

▲ Design Room

MACHINE WORKS

The machine works is functionally laid out to maximize performance of each machine type. Latest NC machines and automatic exclusive machines of our own make are continuously producing interchangeable components of stable quality.

▲ Machine Works

▲ Machining Center

ASSEMBLY PLANT

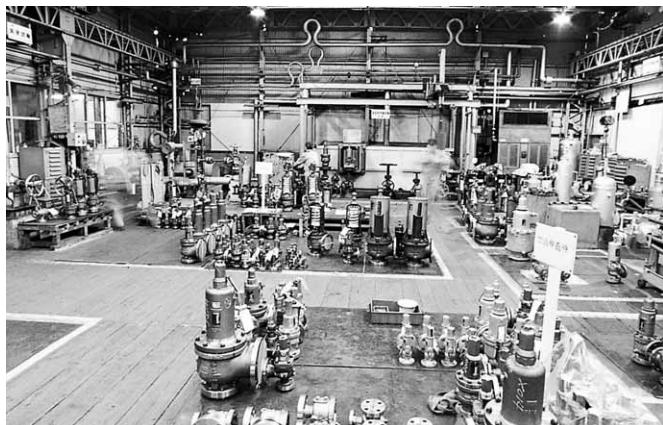

NAKAKITA SEISAKUSHO CO., LTD. as the integrated valve manufacturer is manufacturing various types of valves. Each Assembly Department has its own plant for the respective type of products, and the assured quality is put to the products by skilled hands. And besides, Heat-treatment Shop and Washing Shop are fully furnished and they assure the specifications of customers.

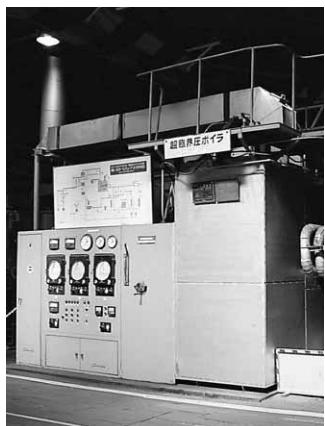

▲ Assembly Plant

INSPECTION SECTION

The inspection Sections for respective products are directly connected to the each Assembly Department, and every products are always carried out strict inspection by experts with excellent modern testing facilities. So the reliable NAKAKITA'S products are forwarded to the society. The followings are the inspection facilities for Safety-Relief Valves.

▲ Inspection Section

▲ Super-critical Pressure Boiler

▲ Cryogenic Test Facility (LN₂•CE)

Tabulated below is the specification sheet for your inquiry and order. Please indicate any plant side condition also if any other than those items listed on the sheet.

Specification	Entry Sample
General	
Application (Equipment Name)	RP Plant
Valve No.	SV-242A
Quantity	1
Applicable Code	ASME Code Section VIII
Service Condition	
Fluid & State (Liquid, Gas or Vapor)	Ethylene (Gas)
Molecular Weight (M) or Specific Gravity (G)	M=28.05
Viscosity	—
Compressibility Factor (Z)	1
Temperature (Nor. / Relieving) (°C)	— / 83
Pressure (Nor. / Design) (MPa)	3.5 / 4.5
Set Pressure (MPa)	4.5
Relieving Pressure (Overpressure%) (MPa)	4.95 (10%)
Closing Pressure (Blowdown) (MPa)	4.05 (0.45)
Back Pressure (Constant or Variable) (MPa)	0
Spring Set Pressure (MPa)	4.5
Required Capacity (kg/h)	11500
Material	
Body, Bonnet, Cap	SA216 WCB
Disc, Nozzle	SUS304
Others	
Spares and Tools	—
Selected Valve	
Conventional, Balanced Bellows or Pilot	Conventional
Bonnet Type (Packed or Open)	Packed
Type	NS255A-E
Size (Inlet × Orifice × Outlet)	40 × G × 80
Connection (Inlet Side × Outlet Side)	ASME 600-1½"RF × ASME 150-3"RF
Rated Capacity (kg/h)	12252
Remarks :	

■ Replacement Parts

For parts order, specific parts name with its number indicated on the approved drawing together with valve's type, size and Nakakita's serial number available on the valve name plate, are definitely needed.
