

## Thermal Imaging

The thermal imaging technology used measures differentials in temperatures and displays them as spectral colors. Cooler temperatures are shown as blacks, blues, and greens (see scale on side of picture below). Warmer temperatures display more in the reds and purples.

**Thermal image of an individual before taking intraMAX™.**

**Thermal image of same individual seconds after intraMAX™.**

The individual shows an increase in blood flow circulation which increases internal body heat. These pictures were taken by an independent party. The thermal imaging equipment used to take these pictures is FDA approved.
