

## HARD WIRING YOUR MONITORS

Do you have a new facility and want to insure you have a “clean look” on the walls for your safety monitors?

Have you been asked by a fire or building official to hard wire your safety monitors in to your buildings electrical system?

Our CM-7000 series safety monitors can accommodate both requests.

By utilizing a 48V-54V DC power converter your electrician can “hard wire” your safety monitors directly in to the buildings electrical system insuring that the power cables are recessed into electrical boxes and conduit rather than exposed on interior walls.

CO2Meter recommends you or your electrician purchase the following converter ([click picture for link](#)):

When properly installed this converter will allow you to hard wire all your safety monitors rather than plugging them in to an outlet.
