ISO 14001 and 9001Certifications

Senseair is ISO certified, which means that we follow a specific process for new product development.

Our process continually checks and verifies our customers requirements and market needs, with the goal of ensuring Senseair technologies meet market needs when commercialized.

Beginning in 2019, Senseair began the IATF 16949 certification process, to ensure that our products are compatible with the global automotive market.

IATF 16949 require Senseair to have an *Advanced Product Quality Plan*, APQP.

The key elements in APQP are:
- Understanding the needs of the customer
- Proactive feedback and corrective action
- Designing within the process capabilities
- Analyzing and mitigating failure modes
- Verification and validation
- Design reviews
- Control special/critical characteristics.
