1. Note: Wheel Guards can only be used in conjunction with Bamboo Footplate. Begin work on only one side of the bike at a time. Remove the inside front mounting screw (located on the Footplate along the chain stay). Place screw through one L-bracket and reinstall onto the footplate chain stay (see Photo 1).
2. Using torque wrench, tighten the footplate screw to 5Nm. Make sure to preserve the proper orientation of the L bracket (the vertical side should be away from the tire, see Photo 2).

3. Remove the two screws located at Points A and B along the seat stay (see Photo 3).

4. Attach Wheel Guard at Point A and Point B along the seat stay and reinstall the screws (see Photo 4A and Photo 4B).
5. Install one provided M5 screw at Point C (through the L-bracket and Wheel Guard), along with one provided nut on the back. Use 8mm wrench to hold nut in place (see Photo 5).

6. Using torque wrench, tighten all three screws holding Wheel Guard in place to 3Nm.

7. Repeat the above steps for other side of the bike.

8. As part of your bike’s regular maintenance, routinely ensure that the Wheel Guard bolts are tightened to the appropriate torque setting.
