

Our 4 pack harness is made to plug directly into the 4 pack gauge.

Removal. Simply pull up on your current trim plate and unplug the front console harness from the trim plate connector.

If your new 4 pack kit didn't come with the traction control switch and power outlet, you will need to remove those from your original trim and swap them onto the new trim.

Remove passenger side dash board trim.

Remove inner sill plate by gently pulling out and up..

Remove side panel trim by releasing both the upper and lower trim clip

Our newest design harness plugs inline with the heater control module which is located right in the corner on the firewall. The connector is hard to see but with a mirror you can see which one you need to disconnect. The brown connector is the one you will be using. The release tab is on the firewall side of the connector. Simply depress the tab and the harness will pull out. Plug our harness back into the module and the other end into the factory harness. Once this is connected you can route the 4 pack connector over to the gauges and plug directly into them.
