

VOYAGER

PREAMP/OVERDRIVE

The Voyager is a gain/preamp overdrive that boasts a full spectrum of tone from any setting on its simple set of controls. From its lowest to highest settings, The Voyager provides a uniquely superb amount of clarity to any style of playing. At lower gain settings, it brightens the signal and adds clarity to each note played. With the gain turned up, the Voyager transforms into a thick overdrive, providing depth to chorded playing while retaining the clarity needed to break through on solos.

9V JACK

9-volt DC, Center Negative, 100ma min.

VOLUME

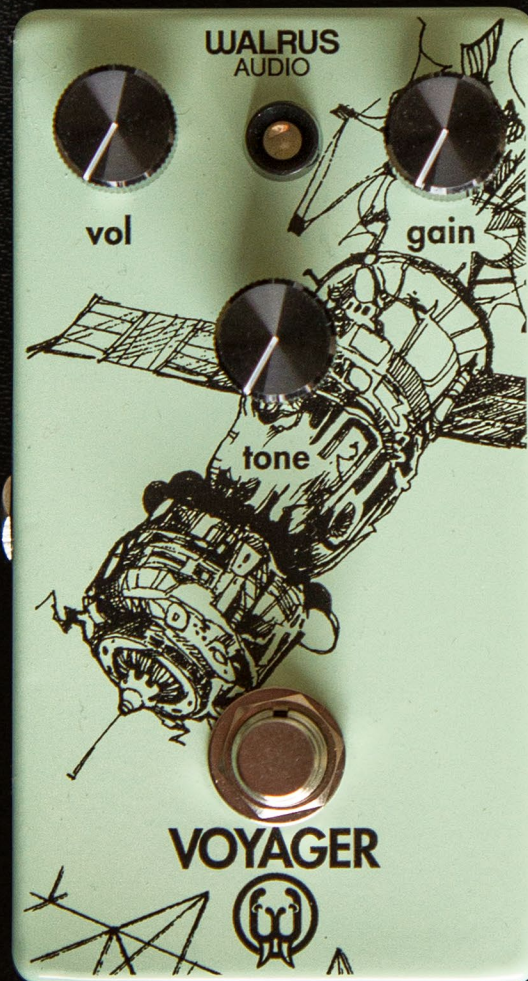

The Volume knob sets the overall output of the pedal.

TONE

Allows specific adjustment of high end/treble frequencies. Turn clockwise to increase amount of high/treble frequencies introduced into the signal. Turn counterclockwise to decrease high/treble frequencies and add low/bass frequencies into the signal.

OUTPUT JACK

1/4 inch cable to amplifier.

BYPASS LED

Illuminated when the effect is on.

GAIN

Adjusts the gain output. As it is increased, the signal becomes grittier and more overdriven. As it is decreased, the signal becomes less gritty and sounds closer to the original, unaffected signal.

INPUT JACK

1/4 inch cable from instrument.

BYPASS SWITCH

Turns the effect on and off.
