

Zada Pro Quick Installation Manual

Installation Parts

Feed Water Connection

The purpose of the feed water connection is to feed the system with water to be purified by tapping the cold water supply which is usually located under the kitchen counter. Please see figure below for instructions on how to make the feed water connection.

Metal Ball Valve "Open"
(Valve handle pointed in same direction as tubing)

Metal Ball Valve "Closed"
(Valve handle perpendicular to tubing)

Faucet Connection

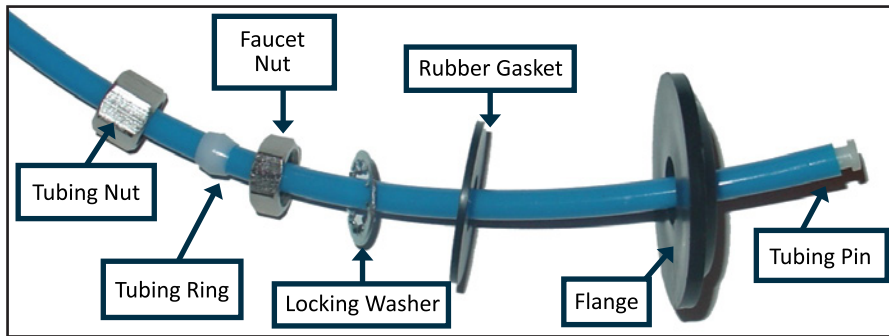

First, a proper location to mount the faucet needs to be selected, paying close attention to the placement of the faucet stem under the counter. Next, use a 5 mm drill bit to open up a pilot hole for the faucet stem. Finally, use a 12 mm drill bit to enlarge the hole to the proper diameter.

Choose the correct type of drill bit for your counter type

Hammer Drill Bit: Cement, Tile, Granite, Marble & Marmoreal

HSS Drill Bit: Steel, Wood, Chrome, Metal & Aluminum

1. Place the faucet through the drilled hole and mount it to the sink per the figures above.
2. Connect the remaining parts of the faucet kit to the end of the "Clean Water" tubing
3. Connect the other end of the tubing to the "Clean Water" port on the system.
