How do I configure Ubuntu for Windows 8/10 system?

It will require a few steps: partitioning the hard drive to allocate space for install. After this is done in Windows, insert the USB stick in the appropriate drive, reboot the machine and instruct the BIOS/UEFI to boot-up from the DVD/USB by pressing a special function key (usually F12, F10 or F2 depending on the vendor specifications) and disable secure boot to enable legacy support. Sometimes you have to disable fast boot as well (also in bios). At this point restart the computer and then you should be able to install/demo Ubuntu.

How do I run Windows programs in Linux?

We recommend WineHQ or PlayOnLinux.

How do I get hardware drivers to work on Linux?

For specific drivers on printers, scanners, video cards, and other I/O devices, we recommend using google and online forums as each device will have its own particular method for best operation in Linux.

How do I get additional help with Linux?

If you need further specific help, please send an email to <u>support@linuxbuilder.com</u>. We recommend watching YouTube tutorials, Googling issues, and performing your own research to learn how to troubleshoot basic problems. Linux is designed as an open source operating system and has a good community support system.
