The steel has a very high hardness because of the stresses to which the instruments are exposed.

This hardness ensures that the instruments stay sharp.

**Stille chisels, osteotomes and mallets** are made of choice quality steel with high HRC hardness. Stille was the first company in the world to manufacture osteotomes and we are today world famous for the superior cutting performance. The special grinding of Stille chisels and osteotomes results in superior quality instruments with very strong tips that are prevented from getting stuck in the bone. The phenolic and stainless steel handles are designed to prevent from slipping.

Osteotomes, chisels and gouges must be very hard to withstand the stress they are exposed to. At the same time it is important that the material gives way when touching implants so that these will not be damaged. The hardness also ensures that the instruments stay sharp for a long period of time.
