INSTRUCTIONS

1. Boil water freshly for each of baby's meals and allow to cool down to 120 degrees Fahrenheit (50 °C).
2. Pour boiled water into a clean and sterilized bottle.
3. Using the scoop provided with your box of formula (note that spoon sizes vary by brand and even lot), add the correct number of leveled scoops of powder (1 leveled scoop of powder per 1oz / 30ml of water).
4. Close the bottle with the nipple and cap and vigorously shake.
5. Cool to drinking temperature (approximately 98 degrees Fahrenheit or ~ 37 °C) and ALWAYS test the temperature of the milk before feeding to avoid scalding or burning your little one.

There are many parents that regularly use distilled water without boiling it prior to mixing, apparently with no negative consequences. We cannot recommend this approach and there are actual reasons even the WHO recommends pre-boiling tap or distilled water. [Watch this video for more insight into this topic.](#)
