

The Electromagnetic Radiation Spectrum

How to read this chart

- This chart is organized in regions (frequency doubling/halving) starting at 100 and going higher (2.0, etc.) lower (1/2, 1/4, etc.). The octaves is a natural way to represent frequency.
- Frequency increases in the upward direction, and wavelength from right to left.
- There is a link to color and this chart, however, the limited space only the "Visible" items have been shown. A frequency of 0Hz is the lowest possible frequency but the method of depicting octaves used here does not allow for representing 0Hz and representing it. Also, by the definition of frequency (cycles per second), there is no such thing as a negative frequency.
- Values labels: Frequency in Hertz (Hz), Wavelength in meters (m), Energy in electronVolts (eV).

Gamma Rays

Gamma radiation is the highest energy radiation (up to 10^{14} eV) that has been measured. At this energy, the radiation is most from gamma-ray sources, gamma-ray bursts, or something else.

Alpha, beta, and delta radiation are not electromagnetic but are actually parts of the atom being released from a radioactive element. In some cases this can cause gamma radiation. These are not to be confused with gamma rays.

Ultraviolet Light (UV)

UV light is beyond the range of human vision. A sunburn can be felt in the UVA range which helps them identify certain tissues.

The UV-A spectrum causes sun tanning which helps to protect against cancer. Exposure to UV-B is beneficial to humans cause by helping the skin produce vitamin D. Excessive UV exposure causes skin damage. UV-C is harmful to humans and is used as a germicide.

The Sun produces a wide range of wavelengths including all the UV light, however, UVB is partially filtered by the ozone layer and UVC is totally filtered out by the earth's atmosphere.

Emission and Absorption

As EMR passes through elements, certain wavelength bands get absorbed and some new ones get emitted. This absorption and emission are characteristic of the elements. For each element, which are useful in determining the distant stars. These lines are used to prove the red-shift movement of distant stars.

When a photon hits an atom it may be absorbed if the energy is just right. The energy level of the electron is raised to a higher energy level. A new photon of specific wavelength is emitted when the energy is released.

Max Planck determined the relationship between the temperature of an object and the radiation it emits. The formula is $E = h \cdot \nu$ where E is the energy, h is Planck's constant, and ν is the frequency.

Visible Spectrum

The range of EMR visible to humans is called "Light". The visible spectrum also closely resembles the range of EMR that flows through our atmosphere from the Sun.

Other organisms see different ranges of visible light, for example bumble-bees can see ultraviolet light and dogs have a different perception of color than humans.

The sky is blue because our atmosphere scatters light and the shorter wavelength blue light scattered the most. It appears that the entire sky is illuminated by a blue light but in fact light is scattered from the Sun. The longer wavelength red and orange light comes straight through the atmosphere which makes the Sun look like a bright white ball containing all the colors of the visible spectrum.

Interacting, the visible spectrum shows approximately nine sections (including/halving of frequency).

Astronomers use filters to capture specific wavelengths and reject unwanted wavelengths. The major astronomical (visual) filter bands are depicted as **W**.

Light Amplification by Stimulated Emission of Radiation (LASER)

A LASER is a device that produces coherent, monochromatic EMR of high intensity.

With proper design, an EMR of visible light, ultraviolet, x-rays, and gamma rays can be used to operate the LASER. A MASER functions similarly to the LASER and is made with microwaves and radio waves.

Radio Bands

The radio spectrum (ELF to EHF) is populated by many more items than can be shown on this chart. Only a small sampling of the bands used around the world are shown. Each country has its own rules and regulations for allocating bands in the region. FCC, CE, CEPT, ETSI, OFCOM, ISM, ITU, etc.

Communication by EMR is done by modulating the carrier waveform.

Radio Detecting And Ranging (RADAR) uses microwaves to detect the distance and speed of objects.

Common Band Radio (CB) contains 40 stations between 26.965 - 27.400MHz. CB is a radio frequency range of 11.2 MHz.

Television (TV)

Terrestrial broadcast TV uses the VHF and UHF ranges (30MHz - 3GHz).

Satellite television is transmitted in the C-band (4 - 8 GHz) and Ku-band (12 - 18 GHz) - where one of the frequencies is used for the uplink and the other for the downlink. The stations are broadcast in alternating polarity, for example C is vertical and Ku is horizontal and vice versa on neighboring satellites.

TV channels transmitted through cable (CATV) are shown as **TV**. CATV channels starting with "T" are channels that link to the cable TV receiver (the new feeds).

Air and cable analog TV stations are broadcast with the appropriate color and audio frequency carriers arranged together in a channel band as follows:

The 15.7 MHz horizontal sweep signal is a common constant to VLF framing.

Older generation methods are used for HDTV broadcasts in order to pack more channels into the same bandwidth as analog TV.

Sound

Although sound, ocean waves, and heartbeats are not electromagnetic, they are included on this chart as a frequency reference. Other properties of electromagnetic waves are different from sound waves.

Sound waves are caused by an oscillating compression of molecules. Sound cannot travel in a vacuum such as outer space.

The speed of sound in air at sea level is 343m/s (767mph), and much faster in water at 5320m/s (12110mph).

Humans can only hear sound between 20Hz to 20kHz. Some bats can hear sound up to 200kHz.

Infrasound (below 20Hz) can be sensed by internal organs and touch. Frequencies in the 0.2Hz range can affect the sense of motion sickness.

The 98 piano keys of the Equal Temperament scale are accurately located on the frequency chart.

The musical note A (A4 or A440 at 440Hz) is depicted on the chart as **A4**.

Over the ages people have striven to divide the continuous audio frequency spectrum into individual musical notes that have harmonious relationships besides the octave. Microtonal musicians study various scales. One recent count lists 4700 different musical scales.

Gravitational Waves

Gravity is the mysterious force which holds large objects together and binds our planets, stars, and galaxies together. No links have been established between gravity and electromagnetic radiation or the other natural forces, the three force, the Electromagnetic force, and the Strong force.

Gravity is theorized to warp space and time. In fact, gravity is responsible for bending light as observed by the gravity lensing of distant stars and galaxies.

"Gravitational waves" appear as ripples in space-time travelling at the speed of light. Long theorized, a gravitational wave was first detected in 2015, and was caused by the merger of two black holes a billion light years away.

Brain Waves

In measuring electricals from the human head to an electroencephalograph (EEG), it is possible to measure very small cyclic electrical signals.

There has been much study on this topic, but the all effects on humans, the findings are not as clear as the benefits of meditation.

Generally, lower brain wave frequencies relate to sleep, and the higher frequencies relate to alertness.

Devices have been made for measuring and stimulating brain waves to achieve a desired state.

Systems International of Units (SI) unit prefixes

Symbol	Exp.	Name
Y	10 ²⁴	Yocto
Z	10 ²¹	Zetta
E	10 ¹⁸	Exa
P	10 ¹⁵	Peta
T	10 ¹²	Tera
G	10 ⁹	Giga
M	10 ⁶	Mega
k	10 ³	Kilo
		1,000
m	10 ⁻³	Milli
μ	10 ⁻⁶	Micro
n	10 ⁻⁹	Nano
p	10 ⁻¹²	Pico
f	10 ⁻¹⁵	Femto
a	10 ⁻¹⁸	Atto
z	10 ⁻²¹	Zetta
yo	10 ⁻²⁴	Yocto

Electromagnetic Radiation (EMR)

EMR is emitted in discrete units called photons, but has properties of waves. EMR can be described as a combination of electric and magnetic fields. EMR travels through void at the speed of light ($c = 2.99792458 \times 10^8$ m/s). EMR consists of an oscillating electric and magnetic field at right angles to each other and spread in a particular wavelength.

Some crystals cause the photons to rotate its polarization.

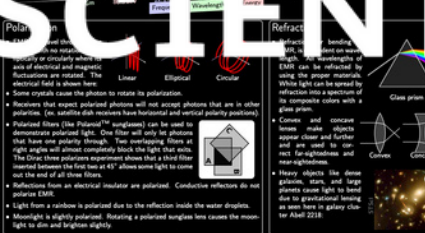

Photons that respect polarized photons will not accept photons that are in other polarizations. (on satellite dish receivers have horizontal and vertical polarity positions).

Polarized filters (the Polaroid™ sunglasses) can be used to demonstrate polarization. One filter will only allow the photons that have one polarity through. The second filter will only allow the photons that have a different polarity through. This is why sunglasses with polarized lenses can reduce glare from water surfaces. The Draz, three polarizers experiment shows that a third filter oriented at an angle between the first two can let some of the light out of all three filters.

Reflection from an electrical insulator is polarized. Conductive reflections do not polarize EMR.

Light from a rainbow is polarized due to the reflection inside the water droplets.

Moonlight is slightly polarized. Rotating a polarized sunglasses lens causes the moonlight to dim and brighten slightly.

Reflection

Reflects EMR if it is perpendicular to the surface. If it is not perpendicular, the wave is reflected back into the medium it came from. The angle of reflection is equal to the angle of incidence.

Refraction: Refracts EMR when it passes from one medium to another. The speed of light is slower in denser media, causing the wave to bend towards the normal.

Infrared (IR)

IR is a form of electromagnetic radiation with a wavelength longer than that of visible light, but shorter than that of microwaves. It is emitted by all objects with a temperature above absolute zero.

IR is used in remote controls, night vision, and thermal imaging. It is also used in astronomy to study the composition of stars and galaxies.

IR is used in medicine for pain relief and in agriculture for crop monitoring.
