Gel Polish

Step 1: To improve adhesion - opt for a true dry manicure.

Thoroughly prepare the natural nail by pushing back the cuticle. Shape the free edge and gently remove shine of the natural nails with **NSI Endurance Buffer**. A Gentle light buffing to remove surface oils will improve adhesion.

Step 2:

Clean and dehydrate using **Nail Pure Plus** on a **Nail Wipe**. Use a scrubbing motion, don't forget the side walls and along the free edge, to ensure a well-dehydrated nail plate prior to application of **Polish Pro Base Coat Plus**.

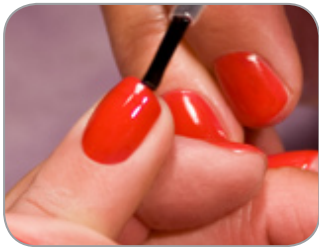

Step 3:

Apply one thin layer of **Polish Pro Base Coat Plus** to all five fingers. Be sure to cap the edges. Always cap first then coat the nail cuticle to free edge. Cure in a **UV Lamp** (36 Watt) for **90 seconds**, or in a **LED Lamp** (36 Watt) for **30 seconds**.

Step 4:

Shake your gel polish colour well before use. Apply a very thin layer of the colour. The first layer should look translucent. Cure in a **UV Lamp** (36 Watt) for **2 minutes**, or in a **LED Lamp** (36 Watt) for **60 seconds**, Apply a second thin coat for full coverage and cure again.

Step 5:

Apply **Polish Pro Top Coat**, cap the edges. Make sure there is no excess of product or build up underneath the free edge or side walls. Cure in a **UV Lamp** (36 Watt) for **2 minutes**, or in a **LED Lamp** (36 Watt) for **60 seconds**. Wait 30 seconds for the nails to cool down, then remove the tacky layer with a Nail Wipe lightly saturated with **NSI Cleanse**.

Step 6:

Condition the cuticle with a drop of **Nurture Oil**. No additional drying time, you will love your smudge-free & chip-proof new manicure. Easy removal in minutes - by buffing the topcoat first & then soaking off with 100% Pure Acetone. **Tip:** We recommend the Nail Bath and the use of 100% Pure Acetone to remove Polish Pro easily and safely. The Soak off Nail Bath gently warms the Acetone and speeds up the nail removal process. **No damage to the natural nails.**
