

Exhaust Rattle Repair Kit – E92

Part #: AGA-ER-E92

Problem:

You hear a rattle from the rear of your vehicle, come to find out the exhaust butterfly valve is loose causing the rattle noise. The valve is only available with the complete exhaust; the exhaust is very costly and requires a fair amount of labor to replace.

Solution:

The AGA Exhaust Rattle Repair kit E92. This kit has a silicon bronze housing that supports the shaft with an internal spring that applies pressure on the shaft eliminating the rattle noise from the exhaust flap. In addition, there is a spring loaded stainless steel clip that provides a small amount of tension between the actuator arm and exhaust flap arm; this eliminates any rattle from the loose/worn arm.

Benefit:

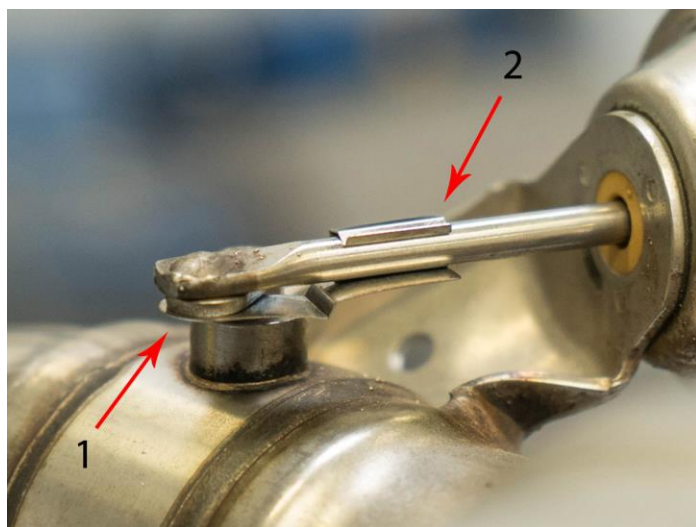

The AGA Exhaust Rattle Repair kit E92 eliminates the need to buy an expensive exhaust and the labor to replace it. The exhaust flap remains operational and you continue getting the increased torque and top end power from the exhaust flap function. The kit installs easily without any special tools.

Before starting, please be sure to watch our instructional video located on YouTube and website at www.agatools.com

1. Clean shaft and shaft housing with Scotch-Brite pad that is provided in the repair kit. It is necessary to remove the carbon build up for proper fitment.

2. Install silicone bronze bushing onto shaft housing. Be sure to direct the bushing as pictured with opening facing directly backwards. This will allow any debris and water to exit towards the back of the vehicle. Use provided 3mm Allen wrench to tighten bolt to 4.0Nm (3lbs.)

3. Align the clip hole over the actuator rod pin (#1). Rotate clip to lock onto the actuator rod (#2).

4. Enjoy your vehicle without the rattle!

Note: Make sure everything is secured and tight.
