 Nozzle spacing (in inches) for broadcast spraying

> - Spray width (in inches) for single nozzle, band spraying or boomless spraying

MPH x W

- Row spacing (in inches) divided by the number of nozzles per row for directed spraying

Useful Formulas for Roadway Applications

$$GPLM = \frac{60 \times GPM}{MPH} \qquad GPM = \frac{GPLM \times MPH}{60}$$

GPLM = Gallons Per Lane Mile

Note: GPLM is not a normal volume per unit area measurement. It is a volume per distance measurement. Increases or decreases in lane width (swath width) are not accommodated by these formulas.

Measuring Travel Speed

Measure a test course in the area to be sprayed or in an area with similar surface conditions. Minimum lengths of 100 and 200 feet are recommended for measuring speeds up to 5 and 10 MPH, respectively. Determine the time required to travel the test course. To help ensure accuracy, conduct the speed check with a partially loaded (about half full) sprayer and select the engine throttle setting and gear that will be used when spraying. Repeat the above process and average the times that were measured. Use the following equation or the table at right to determine ground speed.

Speed (MPH) =
$$\frac{\text{Distance (FT) x 60}}{\text{Time (seconds) x 88}}$$

Suggested Minimum Spray Heights

The nozzle height suggestions in the table below are based on the minimum overlap required to obtain uniform distribution. However, in many cases, typical height adjustments are based on a 1 to 1 nozzle spacing to height ratio. For example, 110° flat spray tips spaced 20 inches apart are commonly set 20 inches above the target.

Not recommended.

^{**} Nozzle height based on 30° to 45° angle of orientation (see page 284 of catalog).

^{***} Wide angle spray tip height is influenced by nozzle orientation. The critical factor is to achieve a double spray pattern overlap.

SPRAYING INFORMATION

SIZE SELECTION OF SPRAY TIP OR NOZZLE

Based on the chemical manufactruer's recommendations on GPA application rates and nozzle types, a suitable spray tip size is chosen from the catolog tabulations. Since all the tabulations are based on spraying water, which weighs 8.34 lbs. per USA gallon, conversion factors must be used when spraying solutions which are heavier or lighter than water. Using conversion factors from the tables below multiply by the catolog tabulated GPM and GPA rates - to arrive at the values for the solution to be sprayed.

Weight of solution	Specific Gravity	Conversion Factors
7.0 lbs. per gallon	.84	.92
8.0 lbs. per gallon	.96	.98
8.34 lbs. per gallon - WATER	1.00	1.00
9.0 lbs. per gallon	1.08	1.04
10.0 lbs. per gallon	1.20	1.10
10.65 lbs. per gallon - 28% nitrogen	1.28	1.13
11.0 lbs. per gallon	1.32	1.15
12.0 lbs. per gallon	1.44	1.20
14.0 lbs per gallon	1.68	1.30

BEFORE YOU GO INTO THE FIELD

Check all your equipment - make certain that all components are clean including the tank, pump, control valves, check valves, hoses, boom, strainers, nozzles, and spray tips.

WARNING: never use a metal object in cleaning nozzle orifices. Use a plastic or wooden probe.

Check the flow rate from all nozzles using a master pressure gauge mounted in the boom close to the nozzles. (After the test remove the master pressure gauge and plug the connection). While this nozzle flow test is being conducted, check the pressure reading on the rig pressure gauge to compare its reading to the pressure at the nozzles. The flow rates can be determined from the flow charts contained in this catolog. Remember, the catalog tabulations are based on pressures at the nozzles.

NOTE: If the ball type check valves are used, the actual nozzle pressure will be approximately 5 P.SI. lower than the gauge reading, depending on spring rating and flow rate.

CHOICE AND CARE OF SPRAY EQUIPMENT

All the factors in todays spraying application, including chemical costs, pollution and driftage control, point to the importance of choosing the proper spray equipment and maintaining it in an efficient operating order. Therefore, the original purchased equipment should be made of materials which resist corrosion and wear such as stainless steel spray tips. Since usage of spray nozzles usually brings about orifice clogging problems, erosion, etc., it is very important that the tips be cleaned after each operation, and tested before using again. Finally even when using precision spray tips, it is necessary to control all the other factors in the spraying application - such as rig speed, spraying pressure, spray height, etc., in order to place the proper amount of chemicals in the proper areas. An established routine of proper maintenance will soon pay for itself.

AFTER SPRAYING

Rinse And Clean All The Spraying equipment - including the spray tips, being careful not to use a metal probe in the orifice. This cleaning routine is especially important after spraying wettable powders. Wash spray tips thoroughly with water or cleaning solution (appropriate for chemical sprayed). Blow out orifice clean and dry. If orifice remains clogged, clean it with a fine bristle (not wire) brush or with a toothpick. Do nor damage the orifice. Water - rinse and dry tips before storing.
