

Honey Hole®

ARTIFICIAL HABITAT

Imitating Nature's Design

Honey Hole Brush

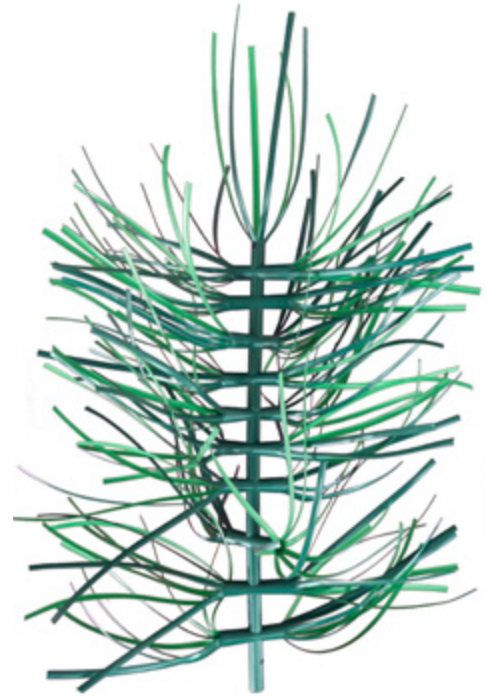

RECOMMENDED PLACEMENT

Bluegill use it as a refuge—Bass use it to ambush prey! The self-righting design allows it to be tossed from the shoreline or a boat. Throw several units in the water spaced a few feet apart and create a larger habitat area for attracting and holding fish. Honey Hole® Brush was designed to be placed in water with depths between 7 to 10 feet.

Assembly Instructions

Honey Hole® Brush requires very little assembly, and can be completed in a few minutes! No tools or glue are necessary. A weight is already included, however for areas with current or high flow, additional weight is suggested.

- Group the (6) leaves at the top of the main stem and slide through the center hole of each of the (10) 4' horizontal limbs, spacing the limbs evenly down the stem. Insert the sealed float at the top of the stem, and then push the retainer into the pre-drilled hole.
- Turn the horizontal limbs to create a random pattern and spread the leaves apart by folding them backward against each limb.
- Once completed, you're ready to toss into the water and watch it sink!

Package Contents

- (1) Retainer
- (1) Plastic Float
- (10) 4' Horizontal Limbs
- (1) 6' Stem with Weight

It is recommended that you wear safety glasses when shaping and installing the Honey Hole Live Series products.
