These bushings are made from a special self lubricating, hard plastic material known as Delrin. The self lubrication property helps to prevent binding and squeaking for extended trouble free operation.

We suggest a light preparation of each trailing arm at both ends to ensure no burrs are present. Preparation most commonly achieved by use of an air tool with an abrasive flapper wheel attachment. Lightly clean and polish both arms inside diameters.

Next, clean and polish the pivot shafts and test fit the new bushings. This may require a slight hone to achieve the perfect interference fit that will provide best performance. These should move freely and not bind.

Note: The inner bushings are marked with a groove and are a slightly different size.
