

The value of a good forage crop!

This picture was taken in 2020. 4 quality cuttings then plowed (shallow) into the soil. 2021 this field was a small grain crop 2022 this field was a corn crop.

The CX-1 applied side (solid stem filled with starches, sugars and other good food for biology) yielded 20-30 bushels more on every acre in the 2022 corn year - 2 years after the alfalfa plowdown.
