WARNING:
Breathing diesel engine exhaust exposes you to chemicals known to the State of California to cause cancer and birth defects or other reproductive harm.

- Always start and operate the engine in a well-ventilated area.
- If in an enclosed area, vent the exhaust to the outside.
- Do not modify or tamper with the exhaust system.
- Do not idle the engine except as necessary.

For more information go to www.P65warnings.ca.gov/diesel

WARNING:
This product can expose you to chemicals including carbon monoxide and benzene, which are known to the State of California to cause cancer and birth defects or other reproductive harm.

For more information go to www.P65Warnings.ca.gov.

Thank you for your purchase of a Power Tech generator set. It is engineered to the utmost quality standards, manufactured in a strict quality control environment, and will assure you a long, satisfactory service. To have the best performance from your Power Tech generator, please fully read and understand this manual.

This manual is written to provide you with the information you need to safely operate and maintain your generator. This manual was up to date at time of printing/download, due to our continuous improvement of our products, we reserve the right to change the information contained in this manual without notice.

Power Tech recommends the use of only genuine Power Tech parts. Other parts may not perform as well, may damage the generator set, and may result in injury. In addition, the use of other parts may void your warranty.

For technical questions on your generator please contact your sales dealer, one of our authorized service centers or Power Tech’s Customer Service Department at 1-800-760-0027. To expedite your call, please have the generator model and serial numbers available.

For service parts, please contact Power Tech’s Parts Department at 1-800-760-0027 or order directly from our website at www.powertechgenerators.com.
This symbol indicates a safety alert. It is used to indicate potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury and death.

This manual has several types of safety precautions and instructions: DANGER, WARNING, CAUTION, NOTICE, and Note.

**DANGER**

Danger indicates the presence of a hazard that *will cause severe personal injury, death, or substantial property damage.*

**WARNING**

Warning indicates the presence of a hazard that *can cause severe personal injury, death, or substantial property damage.*

**CAUTION**

Caution indicates the presence of a hazard that *will or can cause minor personal injury or property damage.*

**NOTICE**

Notice communicates installation, operation, or maintenance information that is safety related but not hazard related.

**Note**

Note indicates additional important or helpful information.
OPERATING SAFETY

Before operating this generator, be sure to read and understand all instructions. This generator set has been designed for safe operation in a specific application. DO NOT modify or use this generator set for any application other than that it has been designed for. Improper usage can cause damage, injury, or death. All installation and service work must be performed by properly trained and qualified personnel. Electrical installation, troubleshooting, and repair should only be performed by a qualified electrician.

The following guidelines should always be obeyed:

- Read, understand and follow all safety precautions and warnings before operating the generator set.
- Be sure to read and follow all safety decals affixed to the generator set.
- DO NOT modify the generator set. Unauthorized modifications may affect the life of the generator set; as well as, result in injury or death.
- The area around the generator set should be clean and free of debris.
- DO NOT operate machinery or equipment while under the influence of alcohol, medication, other drugs, or while fatigued.
- When connecting the generator set, be sure to follow any local, state, and National Electric Code (NEC) guidelines.

Accidental Start-up

This generator set may start without warning. While in operation, there may be exposed moving parts.

- Before working on the generator set or connected equipment, ensure the generator set is disabled. The genset may be disabled by first properly shutting down the generators set. Next, disconnect the battery cables, negative (-) lead first, and/or turn the battery disconnect switch (if equipped) to the OFF position.
Moving Parts

While in operation, there may be exposed moving parts.

- **DO NOT** wear loose, torn, or bulky clothing around the generator set.
- Be sure all guards and shields are in place before operating the generator set.
- Keep your hands and body away from all rotating parts, such as cooling fan, belts, pulleys, etc.
- Stop and disable the generator set before servicing.

Fire

A fire can cause severe injury or death. To reduce the risk of fire:

- **DO NOT** smoke near the fuel system or fuel tank.
- **DO NOT** operate the generator set in the vicinity of spilled fuels or flammable vapors.
- **DO NOT** operate the generator set in the presence of fuel leaks, fuel accumulation, or other flammable materials.
- Keep the engine and engine bay clean and free of accumulated dirt, grease, and trash.
- Keep the genset idling for 5-6 minutes before stopping. Temperatures around the genset may increase suddenly.
- **DO NOT** fill the fuel tank near open flames or while smoking.
- Shut down the generator set and allow it to cool before fueling.
- **DO NOT** run the generator set with a damaged, loose, or missing fuel cap.
- If fuel or lubricants spill, clean up immediately and properly dispose of.
- **DO NOT** attempt to use ether or other starting aids. Doing so may cause a flash fire and/or damage the engine.
- Inspect and replace any damaged wiring if necessary.
Engine Exhaust

**WARNING**

Carbon Monoxide
Can cause severe nausea, fainting, or death.

During operation, the generator set will release engine exhaust into the surrounding atmosphere. This exhaust contains carbon monoxide, an odorless, colorless, tasteless, nonirritating gas. The inhalation of carbon monoxide, even for a short period, can result in death. To reduce the risk of carbon monoxide poisoning:

- Avoid breathing engine exhaust while working on or around the generator set.
- **DO NOT** run the generator indoors unless the exhaust is routed outside properly.
- Routinely inspect the exhaust system for leaks and repair if necessary.
- **DO NOT** operate the generator set where exhaust fumes can accumulate and/or leak into an occupied space.
- **DO NOT** operate the generator set without a properly functioning exhaust system.

Carbon monoxide poisoning symptoms include the following:

- Dizziness, Light Headedness
- Physical Fatigue
- Weakness in muscles and joints
- Sleepiness
- Inability to Concentrate
- Mental Fatigue
- Blurred Vision
- Inability to Speak Clearly
- Stomachache, Nausea, and/or Vomiting

If you experience any of these symptoms, immediately seek fresh air. Remain active and do not sit, lie down, or fall asleep. Seek immediate medical attention if the symptoms do not improve when breathing fresh air.
Voltage Hazard

DANGER

Hazardous Voltage
Will cause severe injury or death.

Whenever electricity is present, there is an electrocution risk. Following proper safety procedures can reduce the risk of electrocution.

- When connecting the generator set, be sure to follow any local, state, and National Electric Code (NEC) guidelines.
- Shut down the generator set and turn off all breakers before servicing the unit.
- Never make electrical connections while standing in water or on wet ground.
- Use extreme caution when testing voltage. It is advisable to have a trained and qualified person take the measurements.
- Inspect and replace any damaged wiring if necessary.
- Make sure all electrical covers are in place before operating the genset.

WARNING

Hazardous Voltage
Backfeed to the utility system can cause property damage, severe injury, or death.

Whenever the generator set is connected as standby power, a transfer switch is required to prevent electrical backfeed into the utility electrical grid. Electrical backfeed is illegal and can result in the severe injury or death of utility company personnel working on power lines. The generator set must be installed following local, state, and National Electric Code (NEC) guidelines.
Burn Hazard

**WARNING**

<table>
<thead>
<tr>
<th>![Hot Engine and Exhaust System]</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Can cause severe injury or death.</strong></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>![Hot Coolant and Steam]</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Can cause severe injury or death.</strong></td>
</tr>
</tbody>
</table>

During operation, some components of the generator set can become extremely hot. These parts include, but are not limited to, the engine, exhaust manifold and piping, muffler, generator end, and voltage regulator. In addition, the engine coolant can become extremely hot and cause pressure to build up in the cooling system. Removing the pressure cap, before allowing the generator set to cool down, could cause hot coolant and/or steam to be released, resulting in severe injury or death.

- **DO NOT** touch or lean against hot exhaust or engine components.
- Allow the generator set to cool down completely before servicing.
- Never make electrical connections while standing in water or on wet ground.

The ECU Series Controller

**INTRODUCTION**

This generator set is equipped with Power Tech’s ECU series electronic generator controller. The ECU series controller provides remote starting capability, as well as, monitoring of the engine and generator for proper operation.

**INTERFACE**

**Status Light**

The ECU series controller communicates its status via an illuminated start/stop switch or other visual indicator light. The following table describes the various flash codes and their meaning:

<table>
<thead>
<tr>
<th>Light Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SLOW FLASHING</td>
<td>The glow plug is active and the engine is cranking.</td>
</tr>
<tr>
<td>SOLID ON</td>
<td>The engine has started and is operating properly.</td>
</tr>
</tbody>
</table>

**FLASHING AFTER SHUTTING DOWN**

| 1 FLASH                    | Over Crank / Failure to Start-                                             |
| 2 FLASHES                  | High Engine Temperature                                                   |
| 3 FLASHES                  | Low Oil Pressure and/or Engine is Not Receiving Fuel                      |
| 4 FLASHES                  | No AC Output.                                                             |
| 5 FLASHES                  | Contact PowerTech Service Department                                     |
| 6 FLASHES                  | Engine Overspeed                                                          |

Once the issue has been corrected, the ECU series controller must be reset by switching the Master Power Switch to the OFF position and returning it back to the ON position.
Operating the Generator Set

**PRE-START**

To ensure proper and reliable operation, always inspect the generator set daily and prior to each startup.

- Verify that the engine oil level is at the correct level. Add if necessary.
- Verify that the coolant is at the correct level. Add if necessary.
- Check for leaks and/or fluids in the compartment. Clean and/or repair as necessary.
- Check fuel level in tank.
- Check battery cables and terminals are secure.
- Check battery terminals for corrosion.
- Check for water in fuel and drain if necessary.
- Verify drive belt tension is correct.
- Inspect all hoses and belts for damage or wear. Replace if necessary.
- Inspect wiring for damage, fraying, bare spots, and proper connection. Replace if necessary.
- Ensure the area around the generator set is free of loose objects and debris.
- Verify all guards and covers are in place and securely fastened.

**MANUALLY STARTING THE GENERATOR SET**

The generator set is designed to be started manually from a remote Start/Stop switch or automatically via an external signal from a transfer switch or other device. The following steps are used to start the generator set manually from a remote switch. Ensure the Pre-Start checks above have been completed before attempting to start the generator set.

1. Ensure the Master Power Switch is in the ON position
2. Press and release the remote mounted Start/Stop switch. After a preprogrammed amount of time, the engine will start.
3. Allow the engine to warm up for 1-2 minutes.
4. Verify that the engine and generator performance is nominal.
5. Continue to monitor the generator set during operation to ensure it is operating correctly.
**AUTO STARTING THE GENERATOR SET**

If desired, the generator set is capable of being started automatically via an external signal from a transfer switch or other device. The following steps are used to set up the controller to accept an external start signal. Ensure the Pre-Start checks above have been completed set-up the generator set to accept an external start system.

**NOTICE:** The genset can be ordered to accept either a MOMENTARY or MAINTAIN start signal from the external equipment. The start signal from the external equipment **MUST** be the same type of signal the genset is ordered for. Depending on your equipment, you may be able to select the appropriate signal. If not, the genset **MUST** be ordered with the appropriate start signal.

**WARNING:** Setting up the generator set to accept an external start signal may cause the generator set to start without warning. This can result in severe injury or death.

Use extreme caution when working around the generator set when it is set-up to accept an external start signal.

**DO NOT** service the generator set without setting the Master Power Switch to the OFF position.

1. Per the wiring diagrams at the end of this manual, wire the transfer switch or other device to the remote plug on the back of the genset.
2. Set the Master Power Switch to the ON position.
3. The generator set is now ready to accept an external start signal.
4. Continue to monitor the generator set during operation to ensure it is operating correctly.

**MANUALLY SHUTTING DOWN THE GENERATOR SET**

The following steps are used to manually shut down the generator set from a remote Start/Stop switch.

1. Turn off any electrical loads powered by the genset.

**NOTICE:** **DO NOT** shut down the generator set under load. Doing so may cause damage to the generator set. Damage caused by shutting down the generator set under load is not covered under warranty.

2. Allow the generator set to cool down by letting it run for 2-3 minutes with no load.
3. Press and release the remote mounted Start/Stop switch.
4. Once the engine has stopped, set the Master Power Switch to the OFF position.

**NOTICE:** **DO NOT** shut down the generator set by setting the Master Power Switch to the OFF position while the engine is running. Doing so may cause damage to the generator set. Damage caused by shutting down the generator set by setting the Master Power Switch to the OFF position while the engine is running is not covered under warranty.
For the longest life and reliable operation, it is important that the generator set is maintained periodically according to the factory’s specifications. Maintenance should be performed in a safe and environmentally friendly manner.

Before servicing this generator, be sure to read and understand all instructions. This generator set has been designed for safe operation in a specific application. **DO NOT** modify or use this generator set for any application other than that it has been designed for. Improper usage can cause damage, injury, or death. All service work must be performed by properly trained and qualified personnel. Electrical troubleshooting, and repair should only be performed by a qualified electrician.

The following guidelines should always be obeyed.

- Read, understand and follow all safety precautions and warnings before operating the generator set.
- Be sure to read and follow all safety decals affixed to the generator set.
- **DO NOT** modify the generator set. Unauthorized modifications may affect the life of the generator set; as well as, result in injury or death.
- **DO NOT** work on machinery or equipment while under the influence of alcohol, medication, other drugs, or while fatigued.
- When making electrical repairs to the generator set, be sure to follow any local, state, and National Electric Code (NEC) guidelines.
- When performing safety checks or generator set service, be sure the generator set is level and well supported. Use only approved stands designed for this type of service.
- **DO NOT** service a generator set that is only supported by a lift jack or hoist.
- Detach the battery from the generator set before conducting any service.
- Be sure to stop and disable the generator set before conducting inspections, maintenance, servicing, and cleaning.
- Check or conduct maintenance only after the generator set has cooled off completely.
- Always use the appropriate tools when performing any service work. Be sure to understand and follow the instructions included with these tools.
- Use ONLY correct engine barring techniques for manually rotating the engine. **DO NOT** attempt to rotate the engine by pulling or prying on the cooling fan and V-belt. Serious personal injury or damage to the generator set may occur.
- Replace fuel hoses and hose clamps at least every 2 years, whether they look damaged or worn. They are made of rubber and gradually deteriorate from the inside out.
- When service is performed with two or more people present, always be aware of their location, especially when starting the generator set.
- Keep a first aid kit and fire extinguisher nearby at all times.

</tbody>
</table>

**Notes:**

1. Engine Oil must be changed after the first 50 hours of service then in 100 hour intervals after the first 50 hours.
2. Filter replacement intervals may vary depending on the quality of air, fuel, etc. These service intervals are maximums and should be adjusted based on the operating conditions of the generator set.
ENGINE OIL MAINTENANCE

High quality engine oil is crucial to reliable operation and increased life expectancy of the generator set. Engine oil provides lubrication and cooling to the internal components of the engine.

Lubricating Oil Specifications

It is important to use a high quality, multi-grade engine oil designed for diesel engines. Engine oil should meet API classification of CC or higher.

The type of engine oil required changes according to the ambient temperature. Refer to the Engine Oil Viscosity Table below in order to determine the oil viscosity for engine operation at the ambient temperature range that is anticipated.

<table>
<thead>
<tr>
<th>Temperature Range</th>
<th>Viscosity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Above 77°F (25°C)</td>
<td>SAE 10W-30 or 10W-40 or 15W-40</td>
</tr>
<tr>
<td>14° to 77°F (-10°C to 25°C)</td>
<td>SAE 10W-30 or 10W-40 or 15W-40</td>
</tr>
<tr>
<td>Below 14°F (-10°C)</td>
<td>SAE 10W-30 or 10W-40</td>
</tr>
</tbody>
</table>

Note: The factory uses and recommends the use of a high-quality SAE 15W-40 diesel engine oil.

NOTICE: The use of low quality, incorrect viscosity, and/or oils not designed for diesel engine applications may result in increased engine wear or engine seizure. Damage caused by using incorrect engine oil is not covered under warranty.

Checking the Engine Oil Level

DANGER
Moving Parts. Will cause severe injury or death.

WARNING
Hot Engine and Exhaust System Can cause severe injury or death.

During operation, some parts of the generator set can become extremely hot. To avoid burns, allow the engine to cool sufficiently before checking the engine oil.

Always stop the engine before checking the engine oil. DO NOT check the engine oil while the engine is running.

Always set the Master Power Switch to the OFF position before checking the oil. If the Master Power Switch to the ON position, the generator set may start automatically, without warning.
1. Shut down the generator set and set the Master Power Switch to the OFF position.
2. Ensure the generator set is on a level surface. If the generator set is on a grade, the oil level measurement may be incorrect.
3. Allow the generator set to sit for at least 5 minutes to allow the generator set to cool and allow oil to flow back to the oil pan.
4. Remove the dip stick, wipe it clean, and replace it.
5. Remove the dip stick again and observe the oil level. The oil should be between the ADD & FULL marks.
6. If necessary, remove the oil cap and add new oil to bring the oil up to the correct level.
7. Replace the dip stick and oil fill cap, if removed.

**Changing the Engine Oil and Cleaning the Filter Screen**

![DANGER]

Moving Parts.
Will cause severe injury or death.

![WARNING]

Hot Engine and Exhaust System
Can cause severe injury or death.

During operation, some parts of the generator set can become extremely hot. To avoid burns, allow the engine to cool sufficiently before changing the engine oil.

Always stop the engine before changing the engine oil. **DO NOT** change the engine oil while the engine is running.

Always set the Master Power Switch to the OFF position before checking the oil. If the Master Power Switch to the ON position, the generator set may start automatically, without warning.

1. Shut down the generator set and set the Master Power Switch to the OFF position.
2. Ensure the generator set is on a level surface and properly supported.
3. Allow the generator set to sit for at least 5 minutes to allow the generator set to cool and allow oil to flow back to the oil pan.
4. Remove the oil drain plug / filter screen from the front of the oil pan and drain old oil into an appropriate container.
5. Gently clean the inside of the filter screen with a light weight oil. Use care not to damage the filter screen. **DO NOT** use any other chemicals, soaps, and/or water to clean the filter screen. This may result in contamination of the engine oil.
6. Reinstall the oil drain plug / filter screen.
7. Remove the oil fill cap, add new engine oil to bring the oil up to the correct level, and replace cap.
8. Clean up any spilled oil.
9. Dispose of old engine oil according to local regulations.
COOLING SYSTEM MAINTENANCE

The cooling system circulates coolant through the engine where it absorbs excess heat from the engine. The coolant then flows through the radiator where this waste heat is exhausted to the atmosphere. Proper maintenance will help prolong the life of your generator set.

Coolant Specifications

It is important to use a high-quality engine coolant. Engine coolant comes in several types. The use of 50/50 mix of an ethylene glycol type of coolant and clean, soft water is recommended for use in this generator set. The use of proper coolant helps prevent freezing, boil over, and corrosion.

<table>
<thead>
<tr>
<th>Coolant Mix (Antifreeze to Water)</th>

<th>Boiling Point</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>°F</td>
<td>°C</td>
</tr>
<tr>
<td>50/50</td>
<td>-34</td>
<td>-37</td>
</tr>
</tbody>
</table>

Checking the Coolant

During operation, some parts of the generator set can become extremely hot. To avoid burns, allow the engine to cool sufficiently before checking the coolant level. DO NOT remove the pressure cap while the radiator is hot. Doing so could result in extremely hot coolant spraying out. Severe burns may result.

Always stop the engine before checking the coolant level. DO NOT check the coolant level while the engine is running.

Always set the Master Power Switch to the OFF position before checking the coolant level. If the Master Power Switch to the ON position, the generator set may start automatically, without warning.

1. Shut down the generator set and set the Master Power Switch to the OFF position.
2. Ensure the generator set is on a level surface and properly supported.
3. Allow the generator set to cool fully.
4. Locate the remotely mounted Surge Tank.
5. Carefully open the pressure cap on the top of the Surge Tank, allowing any pressure to vent before removing.
6. The coolant level should be at the base of the fill neck.
7. If necessary, add 50/50 mix to bring the coolant up to the appropriate level.
8. Replace the radiator cap, ensuring it is tight.

**Changing the Coolant**

<table>
<thead>
<tr>
<th>![WARNING]</th>
<th>![WARNING]</th>
<th>![DANGER]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hot Engine and Exhaust System Can cause severe injury or death.</td>
<td>Hot Coolant and Steam Can cause severe injury or death.</td>
<td>Moving Parts. Will cause severe injury or death.</td>
</tr>
</tbody>
</table>

During operation, some parts of the generator set can become extremely hot. To avoid burns, allow the engine to cool sufficiently before changing the coolant. **DO NOT** remove the pressure cap while the radiator is hot. Doing so could result in extremely hot coolant spraying out. Severe burns may result.

Always stop the engine before changing the coolant. **DO NOT** change the coolant while the engine is running.

Always set the Master Power Switch to the OFF position before checking the oil. If the Master Power Switch to the ON position, the generator set may start automatically, without warning.

1. Shut down the generator set and set the Master Power Switch to the OFF position.
2. Ensure the generator set is on a level surface and properly supported.
3. Allow the generator set to cool fully.
4. Locate the remotely mounted Surge Tank.
5. Carefully open the pressure cap, allowing any pressure to vent before removing.
6. Open the radiator drain on the bottom of the radiator and drain old coolant into an appropriate container.
7. Check all hoses and hose clamps. Replace if necessary.
8. Close radiator drain and refill system with appropriate coolant. It may be helpful to open the Radiator Air Bleed at the top of the radiator to allow any trapped air to escape.
9. Replace the pressure cap, ensuring it is tight.
10. Clean up any spilled coolant.
11. Dispose of old coolant according to local regulations.
Cleaning the Radiator Core

DANGER
Moving Parts.
Will cause severe injury or death.

WARNING
Hot Engine and Exhaust System
Can cause severe injury or death.

During operation, some parts of the generator set can become extremely hot. To avoid burns, allow the engine to cool sufficiently before cleaning the radiator core.

Always stop the engine before cleaning the radiator core. DO NOT cleaning the radiator core while the engine is running.

Always set the Master Power Switch to the OFF position before checking the oil. If the Master Power Switch to the ON position, the generator set may start automatically, without warning.

Due to the large volume of air flowing across the radiator, debris may be pulled into the radiator, clog the fins, and reduce air flow. Reduced air flow across the radiator reduces the cooling efficiency of the radiator and may cause the generator set to run hotter or overheat. Periodic cleaning of the radiator core is recommended to ensure proper air flow.

Remove the radiator shroud and visually inspect the core for any obstructions, such as dirt or other foreign objects. Use running water to flush debris from between the fins.

NOTICE: DO NOT use hard objects to clean the radiator core. DO NOT use high pressure water to clean the radiator core. Damage to radiator could result. Radiator damage caused by improper cleaning is not covered under warranty.
FUEL SYSTEM MAINTENANCE

The fuel system pulls diesel fuel from the fuel tank, filters out water and other contaminants, then conveys it to the engine for combustion. Unused fuel is returned to the fuel tank through a return line. To prevent engine damage and excess wear, the use of proper fuels and proper fuel system maintenance is required.

Fuel Pump

The fuel pump installed on the generator set from the factory is capable of supplying enough fuel to the engine in a wide range of applications; however, installations with long fuel line runs and/or fuel tanks located too far below the generator set may require the use of a secondary fuel pump (not provided).

Fuel Lines

The fuel lines connecting the generator set needs to be a high quality, diesel & oil resistant, multi-layer rubber hose. The hoses should also be resistant to temperatures of at least 212° F (100° C).

To provide an adequate supply of fuel to the engine, the hoses need to be sized appropriately.

<table>
<thead>
<tr>
<th>Supply Line Size</th>
<th>Minimum 5/16&quot; (8mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return Line Size</td>
<td>Minimum 3/16&quot; (5mm)</td>
</tr>
</tbody>
</table>

Fuel Specifications

It is recommended to run a clean, high quality diesel fuel with a minimum cetane rating of 50 in the generator set. The engine can operate on diesel fuels with a sulfur content up to 1.0% (10000 ppm); however, when using high sulfur fuels, with a sulfur content between 0.50% (5000 ppm) and 1.0% (10000 ppm), the engine oil and oil filter change interval is halved. **DO NOT** operate the engine on fuels with a sulfur rating greater than 1.0% (10000 ppm).

**NOTICE:** Always use diesel fuel. **DO NOT** use alternative fuels, such as bio-diesel or kerosene. Damage to the engine may result. Damage caused by using improper fuels is not covered under warranty.

**NOTICE:** The type of diesel fuel and sulfur content used **MUST** be compliant with all applicable emissions requirements in the area in which the generator set will be operated.
Bleeding the Fuel System

DANGER

Moving Parts. Will cause severe injury or death.

WARNING

Hot Engine and Exhaust System Can cause severe injury or death.

During operation, some parts of the generator set can become extremely hot. To avoid burns, allow the engine to cool sufficiently before bleeding the fuel system.

Always stop the engine before bleeding the fuel system. DO NOT bleed the fuel system while the engine is running.

Always set the Master Power Switch to the OFF position before checking the oil. If the Master Power Switch to the ON position, the generator set may start automatically, without warning.

Air can get into the fuel system many ways including if the fuel tank has been run dry, fuel lines have been removed, the fuel filter has been removed, or the generator set has not been used for an extended time. If air has become trapped in the fuel system, use the following steps to bleed the fuel system.

1. Shut down the generator set and set the Master Power Switch to the OFF position.
2. Ensure the generator set is on a level surface and properly supported.
3. Allow the generator set to cool fully.
4. Ensure the fuel tank is full of clean diesel fuel.
5. Disconnect the power leads from the fuel pump.
6. Connect a 12VDC source to the fuel pump leads to power the pump. You will hear the fuel pump run.
7. Allow the pump to run until the system is primed.
8. Disconnect the 12VDC source from the fuel pump.
9. Reconnect the power leads to the fuel pump.
Changing the Fuel Filters

**DANGER**

Moving Parts.
Will cause severe injury or death.

**WARNING**

Hot Engine and Exhaust System
Can cause severe injury or death.

During operation, some parts of the generator set can become extremely hot. To avoid burns, allow the engine to cool sufficiently before changing the fuel filters.

Always stop the engine before changing the fuel filters. **DO NOT** change the fuel filters while the engine is running.

Always set the Master Power Switch to the OFF position before checking the oil. If the Master Power Switch to the ON position, the generator set may start automatically, without warning.

Water, dirt, and other contamination in the fuel can cause the engine to not operate properly, increase wear and/or engine damage. The fuel filters trap these contaminants before they reach the engine. Periodic replacement of the fuel filters is required according to the manufacturer’s schedule. Use the following steps to replace the fuel filters.

**Primary Fuel Filter Replacement**

1. Shut down the generator set and set the Master Power Switch to the OFF position.
2. Ensure the generator set is on a level surface and properly supported.
3. Allow the generator set to cool fully.
4. Unscrew the retainer ring holding the filter cup to the filter body and remove the filter cup.
5. Gently pull down on the filter element to remove it.
6. Install the new fuel filter element.
7. Clean out any water or debris from the inside of the filter cup and reinstall it. **DO NOT** use a wrench or pliers to tighten the retainer ring by hand.
8. Bleed the air from the fuel system.
9. Clean up any spilled fuel.
10. Dispose of the old filter element according to local regulations.

**Inline Fuel Filter Replacement (if equipped)**

1. Shut down the generator set and set the Master Power Switch to the OFF position.
2. Ensure the generator set is on a level surface and properly supported.
3. Allow the generator set to cool fully.
4. Loosen the hose clamp and remove the fuel hose from the barb on the filter.
5. Unscrew the filter from the inlet of the fuel pump.
6. Carefully remove the hose barb from the filter and save.
7. Being careful not to get any inside the filter opening, apply a small amount of diesel safe pipe sealant to the threads on the new filter and hose barb removed earlier. **DO NOT** use Teflon tape.
8. Screw the hose barb on to the filter and tighten. **DO NOT** over tighten.
9. Screw the filter and hose barb assembly on to the inlet side of the pump and tighten. **DO NOT** over tighten.
10. Inspect fuel hose and clamp. Replace if necessary.
11. Reattach the fuel hose and clamp to the hose barb.
12. Bleed the air from the fuel system.
13. Clean up any spilled fuel.
14. Dispose of the old filter according to local regulations
AIR INTAKE SYSTEM MAINTENANCE

The air intake system pulls in outside air, filters out contaminants, and supplies it to the engine for combustion. Changing of the intake air filter is required to prevent engine damage and excess wear.

Changing the Intake Air Filter

**DANGER**

Moving Parts.
Will cause severe injury or death.

**WARNING**

Hot Engine and Exhaust System
Can cause severe injury or death.

During operation, some parts of the generator set can become extremely hot. To avoid burns, allow the engine to cool sufficiently before changing the intake air filter.

Always stop the engine before changing the intake air filter. **DO NOT** change the intake air filter while the engine is running.

Always set the Master Power Switch to the OFF position before checking the oil. If the Master Power Switch is in the ON position, the generator set may start automatically, without warning.

1. Shut down the generator set and set the Master Power Switch to the OFF position.
2. Ensure the generator set is on a level surface and properly supported.
3. Allow the generator set to cool fully.
4. Holding the body of the air filter housing to prevent it from rotating, twist the cap counterclockwise to remove it.
5. Remove the old air filter element.
6. Wipe out any debris from the inside of the air filter housing. **DO NOT** to allow any debris to get into the rest of the air intake system. This may result in engine damage.
7. Install the new filter element ensuring it is properly seated into the housing.
8. Holding the body of the air filter housing to prevent it from rotating, reinstall the cap.
9. Dispose of the old filter element responsibly.
This service log is provided to assist you in keeping track of services performed on the generator set.
