

WRAPPING AND COURIER

All lights are made and shipped from the Western Cape – Winelands area

We cannot be held responsible for the courier services being a 3rd party and we have no control over how the boxes are handled.

All lights are wrapped in foam and bubble wrap with bubble wrap added for the lights not to move too much inside the cartons.

It is then carefully placed inside the cartons with a fragile sticker visible, ready for their new home.

The courier is a 3rd party that you as a client have the option to arrange by yourself or we can help to organise the courier for you.

We cannot be held responsible for the time it takes from collection to delivery as many couriers use an internal party for their deliveries that we have no control over. We will help with the organizing of the courier, but from collection it's not in our hands anymore.

Therefore all courier organized by NM DESIGN are taken on own risk.

CARE INSTRUCTIONS

The clay is not glazed, therefore please take care of the lights as per instructions below:

Please NO detergents. A duster and damp cloth will do the trick to keep them clean and not to harm them.

The lights are very fragile, please handle with care.

It's fragile but yet durable to handle heat as it's baked at a temperature of 1800 degrees Celsius.

SHAPE + MEASUREMENTS

The measurements and shape are an indication only.

No two shapes will be exactly the same and measurements will differ from the measurements given.

Each pendant follows the natural drying process and therefore form its own unique shape.

No moulds are used, only the potters hands. It will therefore shrink when drying and also in the kiln.

We do not have control over the natural process. This is the beauty of handcrafted details!

METHOD

The ceramic lampshades are carefully made by hand with each batch of clay that has its own unique colour variations.

It takes time, skill and effort for the potters to mould each shade.

It follows a natural drying process, which is dependent on the weather, therefore taking longer in the cold winter days than in summer.

When it's fired in the kiln on the specific temperature, it takes time to cool before the kiln can be opened.

When it's too hot and the kiln opens, it will break into pieces.

The lead time is therefore only an indication as we cannot predict the drying time and also the time it will need in the kiln beforehand.

It's an art to make each shade.

LEAD TIME : 4 – 6 WEEKS

LIGHT FITTINGS

OPTION 1 : STANDARD

A standard 1.5m black cord (see below) with a bayonet light fitting. 60 Watt Max, + - 220/230 Volts and ceiling cup of your choice in our accessories collection.

OPTION 2 : CUSTOM

Choose your own fabric cable, lamp holder and ceiling cup from our selection under Accessories on our online shop.
