Squalo Instruction Manual

Winding

For first time use watch should be wound manually. This watch has a special safety screw in crown.

In order to wind it first unscrew the crown by turning it counter-clockwise until it is released.

Then wind it 40 clockwise turns in position A. It will rewind itself automatically as long as it is worn daily. Right sub-dial shows regular seconds.

Setting the Time

To set the time pull crown to position B and turn either direction. Always make sure the crown is locked in position to ensure resistance to water.

Setting Second Time Zone

The main hour and minute hands are also used for the second time zone. Turn crown 2 until the inner bezel reaches the desired second time zone.
