- Diffuse reflection light scanner with visible red light, V-optics and adjustable background suppression
- Due to the V-optics, it is particularly well-suited for detecting very shiny or polished surfaces as well as for transparent objects in a range of 30 ... 70mm
- Very good black/white behavior and precise background suppression
- Exact scanning range adjustment through 8-turn potentiometer
- High switching frequency for detection of fast events

Application notes

- The sensor must be positioned perpendicularly and parallel to the object.
- Objects should only be moved in laterally from the right or left. Moving in objects from the connector side or operating side is not permitted.

- 1) The sensor is most capable of reliably detecting a reflective surface or transparent object in the recommended working range. Nevertheless, the sensor can reliably detect such objects in the entire scanning range; however, the performance reserve is reduced as compared with the recommended working range.

- The sensors are equipped with effective measures for the maximum avoidance of mutual interference should they be mounted opposite one another. Opposite mounting of multiple sensors of the same type should, however, absolutely be avoided.
