

# WATER REPELLENT, ENERGY SAVING PAINT

## Ecocoat Masonry Paint

The Ecocoat masonry paint coating will display its superior water repellence by its beading behaviour.

The coating has a permanent water repellent effect. This is possible because of the silicone resins' organic group which allows the product to be water repellent. The paint is open-pored and does not form a film on the surface, water is unable to penetrate and will merely bead off.

### *An Example of the beading effect of water on masonry.*

Masonry surfaces coated with **Ecocoat Masonry paint** will stay dry for longer periods in the year and will not be as likely to attract fungal or algae growth.

Silicone facade is a durable, energy saving paint that will permit the surface of the building to breathe so that trapped moisture can easily escape through the coating.

This will allow built up damp to dry out and create a dry building.

**Ecocoat Masonry Paint** has been **independently tested** and certified to perform to **EN ISO 15148**.

This is a direct equivalent to **BS (British Standard) EN ISO 15148** (hygrothermal performance of building materials).

Hygrothermal performance is the combination of moisture (in masonry walls) and heat (loss through building surfaces).
