

# Fitting Portiere Rods

Can be fitted to the right or left of all doors and windows

The portiere rod will open and close with the door when the sliding support is used on the door. Alternatively, the pole can be lifted off the sliding support on the door and swung open and placed on the support on the return wall for times when the curtain is not required over the door.

**NOTE: Both sides of the curtain will be visible, so we recommend having a double-sided curtain**

1. Fit the hinge plate to the door frame or adjacent wall (as shown above)
2. Slot the finial into the end of the pole and lock on using one of the lock collars. Leave a 1cm gap between the finial and locking collar to allow for a curtain ring.
3. Offer up the pole and finial to the hinge, mark off required length of pole and cut the pole to size.
4. Slide the exact number of rings required for the curtain onto the pole and push the lock collar over the cut end of the pole.
5. Slide the assembly of pole/finial/rings/lock collars onto the hinge rod and lock in place with the grub screws on the locking collar.
6. Fit the sliding support near the finial end of the pole (allow enough room for the door to open and the pole to slide along the support).
7. Fit the second sliding support on the return wall.
