

FS Performance Engineering VW MK6 Rear Bash Bar Bolt Location

The VW MK6 rear bash bar mounts to the car using the locations for the original rear bar. However, on the left side only 2 bolts are exposed. We recommend using the bash bar to locate the empty hole location. You will need to use a “step down” or “christmas tree” drill bit to open up the hole. Do not drill into the threads. Behind the sheet metal are M8-1.25 threads. We supply a bolt that can be used at this location.

- The empty hole location is on the left side of the car, and in the top right position.
- Use the bash bar to locate and mark the hole location on the car before drilling.
- See below pictures of the location and what the hole location looks like after being drilled.
