MSL-068 LI OPTIMIZED REG/REC FOR SMALL PERMANENT MAGNET CHARGING SYSTEMS WITH MO.UNIT

The MSL-068 Lithium Optimized Permanent Magnet Regulator/Rectifier provides a maximum charge voltage of 14.2V and is suitable for any Lead Acid, AGM, or Lithium motorcycle battery. This is a great reg/rec for many 60's-70's British twins and small to medium displacement bikes with a maximum 200 Watt, 15 Amp charging system.

If possible, before performing this installation, test the original charging system to confirm that the stator is in optimal operating condition. Eliminating this as a variable will simplify troubleshooting during the Reg/Rec install.

There is no substitute for knowledge or experience. Familiarize yourself with the bike, don't make assumptions and when in doubt hire a professional.
