

SUBMERSIBLE AUTOMATIC DRAININAGE PUMPS: KTZE & KTVE

The water level sensor electrode in KTZE and KTVE pumps is a crucial component for automatic operation of the pump. Pumps are susceptible to occasional impacts during installation, or movements between locations in some of the consumer sites, especially in a construction and mining sites.

Therefore, a probe cover made of structure steel to protect the electrode from any harmful impacts is available. This part can be easily installed on any standard KTZE and KTVE pump.
