

## Single-phase Portable Residue Drainage Pumps: FAMILY Adapter

Among the residue drainage pump series like LSP, LSC and HSR, it is easy to forget that Tsurumi's FAMILY pump can also be operated for residue water drainage with an optional adapter. The standard FAMILY pump with its compact design and portability due to light-weight nature gives it the perfect combination to be used in pumping small puddles of stagnant water.

By placing the rubber adapter inside the strainer at the suction mouth, the position of suction is brought nearer to the floor. This enables the pump to pump out water up to 1mm depth. With this special feature, shallow residual water from construction site floors, underground parking floors, or any other surface with excess water can be easily drained. This can also help to dry out any wet surface quickly.
