

**Five** Sensor learning mode  
**Seconds**

In a very unlikely case, sensor could be broken or missed. Sensor learning mode can provide an alternative way to replace sensors with 'learnable sensors'. ('Learnable sensor' will need to purchase separately.) LCD monitor can reload new identified number only from 'learnable sensor.' By obtaining new identified number from new 'learnable sensor', the system will integrate this sensor into its system and replace old one.

Pressing "**Backlight button**" for around 5 seconds, the system will enter 'learning mode', and system will start to recognize new sensors.

As long as enter this mode, insert battery into 'learnable sensor' immediately, the LCD monitor will beep once and finish learning process.

Take number 1 for example

The 'learning mode' will continue for about 30 seconds and then back to main screen.
