

# Quick Start Guide: Statesman Portable Toilet

## To Set Up:

### 1. Fill up the fresh water tank with water.

To access the fresh water tank, simply unscrew the Filler Cap next to the basin and add water through a garden hose. The water will be used for flushing the toilet and washing your hands.

*Note: To drain the water tank, simply unscrew the Drain Plug found underneath the basin (above the small foot pump).*

### 2. Place some water in the waste tank.

To access the waste tank, simply lift the toilet bowl and add in 10-20 litres of water through a garden hose or bucket. The water will help to break down and liquify the waste.

### 3. Throw in some deodorisers.

Add a Deodoriser Tablet to the waste tank to neutralize any odours. For ongoing maintenance, repeat this step every 1-2 weeks.

## To Service:

### If you DO NOT have a Rear Waste Valve:

1. Your toilet will need to be serviced by a liquid waste management company. A liquid waste management company will remove the waste by lifting the toilet bowl and using a vacuum hose.

### If you DO have a Rear Waste Valve:

*Note: If you have a Rear Waste Valve, you will also need a Type D Alloy 75mm Female Camlock x 75mm Female NPT Thread AND a 3m Lay Flat Hose with 3" Male Camlock Fitting.*

1. To service the toilet, screw the Type D Camlock onto the Rear Waste Valve and hook the hose up.
2. To open the Rear Waste Valve, lift upwards on the handle.
3. Once the Rear Waste Valve is opened, gravity will feed the waste out from the waste tank. It is important to keep the toilet slightly elevated during this process.
4. Once the waste has been removed, lift the toilet bowl up and either use a garden hose or buckets of water to flush out any excess waste.
