General Cleaning

- Brush off any loose dirt with a soft, non-metallic brush; vacuum if needed.
- Prepare a cleaning solution of 2 ounces (1/4 cup) mild soap per gallon of lukewarm water.
- Wash with a soft brush or a sponge.
- Rinse copiously (spray) with clean water.
- Allow the fabric to dry completely in the open air, well spread out.
- * Note: If the textile can be removed from its base, it may be machine-cleaned at a temperature less than 40° C.

Warning:

Some spots may be hard to get rid of using the above cleaning procedure. Their properties may make them uncleanable by the usual methods and it may be necessary to use products that can be harmful to textiles. So before using them, it is advisable to consider whether you really need to. You may need the services of a specialist.

Generally speaking, you should not use solvents or abrasives. The resistance of our textiles to chemicals depends on a number of factors such as the form of the chemicals (solid, liquid or gaseous), temperature, concentration and contact time. In some cases, a mixture of cleaning agents can be harmful even though each product on its own is not.

Consequently the following products are prohibited:

- Abrasives of any sort, powders, pastes, liquids, abrasive sponges and pressured steam generators.
- Organic chemical products such as acetone, petrol, benzene fuel oil, kerosene, perchlorethylene, terebenthine, toluene, trichlorethylene and petroleum.
- Inorganic chemical products such as ammonia, nitric acid, sulphuric acid, acetic acid, hydrochloric acid, soda, cauctic soda and bleach water.
