

СПУТНИК

Sputnik is an all-germanium fuzz, featuring a vintage Soviet diode and transistors. The controls of the Sputnik are very interactive with each other. For instance, adjusting the **РЯЗМЯХ** control affects how the **ВЫВЕРЯТЬ** control reacts. This is a pedal to spend some creative quality time with, in order to truly discover the plethora of possible tones within.

As is the case with most vintage germanium inspired circuits, Sputnik works best at the beginning of your pedal chain, in direct contact with your instrument. Otherwise, pedals in front of it should be true-bypass only, as "buffered bypass" pedals may affect the Sputnik's true tone.

СИГНАЛ - Output volume

РЯЗМЯХ - Fuzz gain

ВЫВЕРЯТЬ - Tone control. When set to either extreme of the dial, distinctly different tones emerge.

СОЧЕТАТЬ/ДРЕЙФОВАТЬ - Enables corruption when in **ДРЕЙФОВАТЬ** mode.

ПОИСК - Adjusts level of corruption, only when in **ДРЕЙФОВАТЬ** mode.

ОТТЕНОК/ПРИМЕНЯТЬ = Enables bass cut with mid-scoop filter.

For battery access, remove the four screws on the bottom of the pedal and lift the bottom cover. A regulated 9v-12v DC adapter with **negative center** may be used, with the 2.1mm jack located next to the **OUT** jack. Please contact Spaceman if you are unsure about your DC adapter.

This pedal utilizes true-bypass foot-switching. Unplugging the **IN** jack disconnects the battery; unplug the cable when not in use to save your battery!
